To expedite distribution, this document is circulated as received from the committee secretariat. ISO Central Secretariat work of editing and text composition will be undertaken at publication stage.

Pour accélérer la distribution, le présent document est distribué tel qu'il est parvenu du secrétariat du comité. Le travail de rédaction et de composition de texte sera effectué au Secrétariat central de l'ISO au stade de publication.

THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 230-2 was prepared by Technical Committee ISO/TC 39, *Machine tools*, Subcommittee SC 2, *Test conditions for metal cutting machine tools*.

This third edition cancels and replaces the second, which has been technically revised.

ISO 230 consists of the following parts, under the general title *Test code for machine tools*:

- *Part 1: Geometric accuracy of machines operating under no-load or quasi-static conditions*
- *Part 2: Determination of accuracy and repeatability of positioning numerically controlled axes*
- *Part 3: Determination of thermal effects*
- *Part 4: Circular tests for numerically controlled machine tools*
- *Part 5: Determination of the noise emission*
- *Part 6: Determination of positioning accuracy on body and face diagonals (Diagonal displacement tests)*
- *Part 7: Geometric accuracy of axes of rotation*
- *Part 8: Determination of vibration levels [Technical Report]*
- *Part 9: Estimation of measurement uncertainty for machine tool tests according to series ISO 230, basic equations [Technical Report]*
- *Part 10: Determination of the measuring performance of probing systems of numerically controlled machine tools*

The following part is under preparation:

- *Part 11: Measuring Instruments and their application to machine tool geometry tests [Technical Report]*

Annex A, Annex B, Annex C and Annex D are informative.

## Introduction

The purpose of ISO 230 (all parts) is to standardize methods for testing the accuracy of machine tools, excluding portable power tools.

This part of ISO 230 specifies test procedures used to determine the accuracy and repeatability of positioning numerically controlled axes. The tests are designed to measure the relative displacements between the component that holds the tool and the component that holds the workpiece.

The supplier/manufacturer should provide thermal specifications for the environment in which the machine can be expected to perform with the specified accuracy. The machine user is responsible for providing a suitable test environment by meeting the supplier/manufacturer's thermal guidelines or otherwise accepting reduced performance. An example of environmental thermal guidelines is given in ISO 230-3:2005, Annex C.

A relaxation of accuracy expectations is required if the thermal environment causes excessive uncertainty or variation in the machine tool performance and does not meet the supplier/manufacturer's thermal guidelines. If the machine does not meet performance specifications, the analysis of the uncertainty due to the compensation of the machine tool temperature, given in A.2.4 of this part of ISO 230, and the uncertainty due to the environmental variation error, given in A.2.5, can help in identifying sources of problems.

# Test code for machine tools —

## Part 2:

# Determination of accuracy and repeatability of positioning of numerically controlled axes

## 1 Scope

This part of ISO 230 specifies methods for testing and evaluating the accuracy and repeatability of the positioning of numerically controlled machine tool axes by direct measurement of individual axes on the machine. These methods apply equally to linear and rotary axes.

When several axes are simultaneously under test, the methods do not apply.

This part of ISO 230 can be used for type testing, acceptance tests, comparison testing, periodic verification, machine compensation, etc.

The methods involve repeated measurements at each position. The related parameters of the test are defined and calculated. Their uncertainties are estimated as described in ISO/TR 230-9:2005, Annex C.

Annex A (informative) presents the estimation of the measurement uncertainty.

Annex B (informative) describes the application of an optional test cycle — the step cycle. The results from this cycle are not to be used either in the technical literature with reference to this part of ISO 230, nor for acceptance purposes, except under special written agreements between supplier/manufacturer and user. Correct reference to this part of ISO 230 for machine acceptance always refers to the standard test cycle.

Annex C (informative) contains considerations on alternative tests for the determination of periodic positioning error.

Annex D (informative) describes alternative tests using ball array and step gauge.

## 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 230-1:2011 *Test code for machine tools – Part 1: Geometric accuracy of machines operating under no-load or quasi-static conditions.*

ISO 230-3:2007 *Test code for machine tools – Part 3: Determination of thermal effects.*

ISO/TR 230-9:2005 *Test code for machine tools – Part 9: Estimation of measurement uncertainty for machine tool tests according to series ISO 230, basic equations.*

## 3 Terms and definitions

For the purposes of this document, the following terms, definitions and symbols apply.

**3.1**

**axis travel**

maximum travel, linear or rotary, over which the moving component can move under numerical control

NOTE For rotary axes exceeding 360°, there may not be a clearly defined maximum travel.

**3.2**

**measurement travel**

part of the axis travel, used for data capture, selected so that the first and the last target positions can be approached bi-directionally

See Figure 1.

**3.3**

**functional point**

cutting tool centre point or point associated with a component on the machine tool where cutting tool would contact the part for the purposes of material removal

[ISO 230-1:2011, definition 3.4.2]

NOTE In this part of ISO 230, tests address errors in the relative motion between the component of the machine that carries the cutting tool and the component that carries the workpiece. These errors are defined and measured at the position or trajectory of the functional point.

**3.4**

**target position**

$P_i (i = 1 \text{ to } m)$

position to which the moving component is programmed to move

NOTE The subscript  $i$  identifies the particular position among other selected target positions along or around the axis.

**3.5**

**actual position**

$P_{ij} (i = 1 \text{ to } m; j = 1 \text{ to } n)$

measured position reached by the functional point on the  $j$ th approach to the  $i$ th target position

**3.6**

**positioning deviation**

deviation of position

$x_{ij}$

actual position reached by the functional point minus the target position

$$x_{ij} = P_{ij} - P_i$$

NOTE 1 Adaptation of ISO 230-1:2011, definition 3.4.6

NOTE 2 Positioning deviations are determined as the relative displacements between the component that holds the tool and the component that holds the workpiece in the direction of motion of the axis under test.

NOTE 2 Positioning deviations constitute a limited representation of positioning error motion, sampled at discrete intervals.

**3.7**

**unidirectional**

refers to a series of measurements in which the approach to a target position is always made in the same direction along or around the axis

NOTE The symbol  $\uparrow$  signifies a parameter derived from a measurement made after an approach in the positive direction, and  $\downarrow$  one in the negative direction, e.g.  $x_{ij}\uparrow$  or  $x_{ij}\downarrow$ .

**3.8****bi-directional**

refers to a parameter derived from a series of measurements in which the approach to a target position is made in either direction along or around the axis

**3.9****expanded uncertainty**

quantity defining an interval about the result of a measurement that can be expected to encompass a large fraction of the distribution of values that could reasonably be attributed to the measurand

[ISO/IEC Guide 98-3:2008, definition 2.3.5]

**3.10****coverage factor**

numerical factor used as a multiplier of the combined standard uncertainty in order to obtain an expanded uncertainty

[ISO/IEC Guide 98-3:2008, definition 2.3.6]

**3.11****mean unidirectional positioning deviation at a position**

$\bar{x}_i \uparrow$  or  $\bar{x}_i \downarrow$

arithmetic mean of the positioning deviations obtained by a series of  $n$  unidirectional approaches to a position  $P_i$

$$\bar{x}_i \uparrow = \frac{1}{n} \sum_{j=1}^n x_{ij} \uparrow$$

and

$$\bar{x}_i \downarrow = \frac{1}{n} \sum_{j=1}^n x_{ij} \downarrow$$

**3.12****mean bi-directional positioning deviation at a position**

$\bar{x}_i$

arithmetic mean of the mean unidirectional positioning deviations  $\bar{x}_i \uparrow$  and  $\bar{x}_i \downarrow$  obtained from the two directions of approach at a position  $P_i$

$$\bar{x}_i = \frac{\bar{x}_i \uparrow + \bar{x}_i \downarrow}{2}$$

**3.13****reversal value at a position**

$B_i$

value of the difference between the mean unidirectional positioning deviations obtained from the two directions of approach at a position  $P_i$

$$B_i = \bar{x}_i \uparrow - \bar{x}_i \downarrow$$

**3.14****reversal value of an axis**

$B$

maximum of the absolute reversal values  $|B_i|$  at all target positions along or around the axis

$$B = \max. [|B_i|]$$

**3.15**  
**mean reversal value of an axis**

$\bar{B}$   
 arithmetic mean of the reversal values  $B_i$  at all target positions along or around the axis

$$\bar{B} = \frac{1}{m} \sum_{i=1}^m B_i$$

**3.16**  
**estimator for the unidirectional axis positioning repeatability at a position**

$s_i \uparrow$  or  $s_i \downarrow$   
 estimator of the standard uncertainty of the positioning deviations obtained by a series of  $n$  unidirectional approaches at a position  $P_i$ .

$$s_i \uparrow = \sqrt{\frac{1}{n-1} \sum_{j=1}^n (x_{ij} \uparrow - \bar{x}_i \uparrow)^2}$$

and

$$s_i \downarrow = \sqrt{\frac{1}{n-1} \sum_{j=1}^n (x_{ij} \downarrow - \bar{x}_i \downarrow)^2}$$

**3.17**  
**unidirectional positioning repeatability at a position**

$R_i \uparrow$  or  $R_i \downarrow$   
 range derived from the estimator for the unidirectional axis positioning repeatability at a position  $P_i$  using a coverage factor  $k = 2$

$$R_i \uparrow = 4s_i \uparrow$$

and

$$R_i \downarrow = 4s_i \downarrow$$

**3.18**  
**bi-directional positioning repeatability at a position**

$R_i$   
 $R_i = \max.[2s_i \uparrow + 2s_i \downarrow + |B_i|; R_i \uparrow; R_i \downarrow]$

**3.19**  
**unidirectional positioning repeatability**

$R \uparrow$  or  $R \downarrow$   
 maximum value of the positioning repeatability at any position  $P_i$  along or around the axis

$$R \uparrow = \max.[R_i \uparrow]$$

$$R \downarrow = \max.[R_i \downarrow]$$

**3.20****bi-directional positioning repeatability of an axis** $R$ maximum value of the repeatability of positioning at any position  $P_i$  along or around the axis

$$R = \max. [R_i]$$

**3.21****unidirectional systematic positioning error of an axis** $E \uparrow$  or  $E \downarrow$ the difference between the algebraic maximum and minimum of the mean unidirectional positioning deviations for one approach direction  $\bar{x}_i \uparrow$  or  $\bar{x}_i \downarrow$  at any position  $P_i$  along or around the axis

$$E \uparrow = \max. [\bar{x}_i \uparrow] - \min. [\bar{x}_i \uparrow]$$

and

$$E \downarrow = \max. [\bar{x}_i \downarrow] - \min. [\bar{x}_i \downarrow]$$

**3.22****bi-directional systematic positioning error of an axis** $E$ difference between the algebraic maximum and minimum of the mean unidirectional positioning deviations for both approach directions  $\bar{x}_i \uparrow$  and  $\bar{x}_i \downarrow$  at any position  $P_i$  along or around the axis

$$E = \max. [\bar{x}_i \uparrow; \bar{x}_i \downarrow] - \min. [\bar{x}_i \uparrow; \bar{x}_i \downarrow]$$

**3.23****mean bi-directional positioning error of an axis** $M$ difference between the algebraic maximum and minimum of the mean bi-directional positioning deviations  $\bar{x}_i$  at any position  $P_i$  along or around the axis

$$M = \max. [\bar{x}_i] - \min. [\bar{x}_i]$$

**3.24****unidirectional positioning error of an axis**

unidirectional positioning accuracy of an axis

 $A \uparrow$  or  $A \downarrow$ range derived from the combination of the mean unidirectional systematic positioning errors and the estimator for the unidirectional positioning repeatability of an axis using a coverage factor  $k = 2$ 

$$A \uparrow = \max. [\bar{x}_i \uparrow + 2s_i \uparrow] - \min. [\bar{x}_i \uparrow - 2s_i \uparrow]$$

and

$$A \downarrow = \max. [\bar{x}_i \downarrow + 2s_i \downarrow] - \min. [\bar{x}_i \downarrow - 2s_i \downarrow]$$

NOTE The concept "positioning accuracy" is here applied in a quantitative form and is different from the concept "measurement accuracy" as defined in ISO/IEC Guide 99, definition 2.13.

**3.25****bi-directional positioning error of an axis**

bi-directional positioning accuracy of an axis

A

range derived from the combination of the mean bi-directional systematic positioning errors and the estimator for axis repeatability of bi-directional positioning using a coverage factor  $k = 2$

$$A = \max. [\bar{x}_i \uparrow + 2s_i \uparrow; \bar{x}_i \downarrow + 2s_i \downarrow] - \min. [\bar{x}_i \uparrow - 2s_i \uparrow; \bar{x}_i \downarrow - 2s_i \downarrow]$$

NOTE The concept "positioning accuracy" is here applied in a quantitative form and is different from the concept "measurement accuracy" as defined in ISO/IEC Guide 99, definition 2.13.

**4 Test conditions****4.1 Environment**

It is recommended that the supplier/manufacturer offer guidelines regarding the kind of thermal environment acceptable for the machine to perform with the specified accuracy.

Such guidelines could contain, for example, a specification on the mean room temperature, maximum amplitude and frequency range of deviations from this mean temperature, and environmental thermal gradients. It shall be the responsibility of the user to provide an acceptable thermal environment for the operation and the performance testing of the machine tool at the installation site. However, if the user follows the guidelines provided by the machine supplier/manufacturer, the responsibility for machine performance according to the specifications reverts to the machine supplier/manufacturer.

Ideally, all dimensional measurements are made when both the measuring instrument and the measured object are soaked in an environment at a temperature of 20 °C. If the measurements are taken at temperatures other than 20 °C, then correction for nominal differential expansion (NDE) between the axis positioning system or the workpiece/tool holding part of the machine tool and the test equipment shall be applied to yield results corrected to 20 °C. This condition might require temperature measurement of the representative part of the machine as well as the test equipment and a mathematical correction with the relevant thermal expansion coefficients. The NDE correction might also be achieved automatically, if the representative part of the machine tool and the test equipment have the same temperature and the same thermal expansion coefficient.

It should be noted, however, that any temperature departure from 20 °C can cause an additional uncertainty related to the uncertainty in the effective expansion coefficient(s) used for compensation. A typical minimum range value for the resulting uncertainty is 2 µm/(m·°C) (see annex A). Therefore, the actual temperatures shall be stated in the test report.

The machine and, if relevant, the measuring instruments shall have been in the test environment long enough (preferably overnight) to have reached a thermally stable condition before testing. They shall be protected from draughts and external radiation such as sunlight, overhead heaters, etc.

For 12 h before the measurements and during them, the environmental temperature gradient in degrees per hour shall be within limits agreed between supplier/manufacturer and user.

**4.2 Machine to be tested**

The machine shall be completely assembled and fully operational. If necessary, levelling operations and geometric alignment tests shall be completed satisfactorily before starting the accuracy and repeatability tests.

If built-in compensation routines are used during the test cycle, this should be stated in the test report.

All tests shall be carried out with the machine in the unloaded condition, i.e. without a workpiece.

The positions of the axis slides or moving components on the axes which are not under test shall be stated in the test report.
