Nahrungsmittelmaschinen - Teigausrollmaschinen -
Sicherheits- und Hygieneanforderungen

This European Standard was approved by CEN on 11 June 2000.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

Foreword

This European Standard has been prepared by Technical Committee CEN/TC 153 " Food processing machinery - Safety and hygiene specifications", the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by March 2001, and conflicting national standards shall be withdrawn at the latest March 2001

This European Standard has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association, and supports essential requirements of EU Directive(s).

For relationship with EU Directive(s), see informative Annex ZA, which is an integral part of this standard.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

<https://standards.iteh.ai/catalog/standards/sist/6c1d6284-14b4-485e-b5ac-e42bd3095027/sist-en-1674-2002>

0 Introduction

The extent to which hazards are covered is indicated in the scope of this standard. In addition, machinery shall comply as appropriate with EN 292 for hazards which are not covered by this standard.

1 Scope

This standard specifies safety and hygiene requirements for the design and manufacture of dough and pastry brakes used in the food industry and shops (bread-making, pastry-making, sweet industries, bakeries, confectioners, delicatessens, catering facilities, etc) for reducing the thickness of a solid mass of dough or pastry by rolling it out. The operation is generally carried out by passing the dough back and forth between the rollers whose distance apart is reduced progressively either by manual adjustment or automatically.

The standard covers the technical safety requirements for the installation, adjustment, operation, cleaning and maintenance of these machines, as defined in 3.12 of EN 292-1:1991 and in the manufacturer's instruction handbook.

The significant hazards covered by this standard are mechanical (drawing-in, crushing, shearing, cutting, entanglement and loss of stability), electrical, ergonomic and those resulting from inhalation of flour dust and lack of hygiene. The hazards are specifically listed in 5. Noise is not considered to be a significant hazard from dough and pastry brakes. This does not mean that the manufacturer of the machine is absolved from reducing noise and making a noise declaration. Therefore a noise test code is specified in Annex B.

It applies only to machines manufactured after the date of issue of the standard.

The following machines are excluded :

- experimental and testing machines under development by the manufacturer ;
- domestic appliances ¹⁾.

2 Normative references

This European Standard incorporates, by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this European Standard only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

3 Description

A dough and pastry brake usually consists of a machine frame mounted on a mobile or fixed base or placed on a table or a support. The frame supports the following components :

- a) the electric motor which drives the rollers ;
- b) two superimposed rollers. The height of the lower one is fixed, the height of the upper one can be adjusted to obtain dough of the desired thickness. The two rollers rotate in opposite directions ;
- c) scraping devices to remove dough residue from the rollers ;
- d) a table or a conveyor on either side of the rollers ;
- e) the control system which includes an on/off switch, a device for reversing the direction of rotation, and a roller gap adjustment control ;
- f) an optional attachment to spread flour ;
- g) optional devices to cut dough and to roll dough. The cutting device is used at the end of the rolling phase to cut predetermined forms from the dough. The system is often composed of a roller fitted with circular knives for making bands, and of a roller fitted with imprints to make special forms such as croissants, chocolate filled pastry tartlets, etc.

The capacity of the machine is defined by :

- the width of the infeed table (or conveyors).

Figure 1 : Main parts of a dough and pastry brake

4 Definition

In addition to ENV 1070 the following definitions apply :

manual operation : The rollers and conveyor belts are driven by electric motor and the roller gap is adjusted by hand control ;

automatic operation : Adjustment of the roller gap is by electric motor and it is normally automatically controlled, e.g. by microprocessor.

5 List of hazards

This clause contains those hazards identified by risk assessment (see EN 1050) as specific and significant for dough and pastry brakes and which require action to reduce risk.

5.1 Mechanical hazards

The significant mechanical hazards, are :

- drawing-in and crushing hazard ;
- shearing hazard ;
- cutting hazard ;
- entanglement hazard ;
- loss of stability.

The example in figure 2 shows danger zones.

[SIST EN 1674:2002](https://standards.iteh.ai/catalog/standards/sist/6c1d6284-14b4-485e-b5ac-e42bc3095027/sist-en-1674-2002)

<https://standards.iteh.ai/catalog/standards/sist/6c1d6284-14b4-485e-b5ac-e42bc3095027/sist-en-1674-2002>

Figure 2 : Danger zones of a dough and pastry brake

- Zone 1 : gap between the two rollers on the inrunning side (hazards : drawing-in and crushing) ;
- Zone 2 : gap between a roller and the input and output tables or conveyor belts on each side of the rollers (hazards : drawing-in and crushing) ;
- Zone 3 : gap between the rollers and the side guards (hazard : crushing) ;
- Zone 4 : drive mechanism (hazards : shearing and entanglement) ;
- Zone 5 : input and output devices :
 gap between conveyor belts and their drive or guide rollers.(hazards : drawing-in and crushing) ;
- Zone 6 : power driven cutting devices (hazard : cutting) ;
- Zone 7 : removable attachment to spread flour (hazard : drawing-in and crushing).

5.2 Electrical hazards

Hazard of electric shock from direct or indirect contact with live components.

Hazard of external influences on electrical equipment (e.g. cleaning with water).

5.3 Hazards resulting from inhalation of dust

Use of dough and pastry brakes exposes operators to dust including flour and ingredients which may be harmful to their health, causing rhinitis (running noses), watering eyes and possibly occupational asthma.

The major sources of airborne dust on these machines are as follows :

- flour used directly to prevent dough sticking to the belt, table or rollers ;
- flour generated during filling of the dusting reservoir and during cleaning of the machine.

(standards.iteh.ai)

5.4 Hazard generated by neglecting hygienic design principles

The neglection of hygienic principles can create unacceptable modification of foodstuff and therefore a risk to human health, i.e. through physical, chemical or microbial pollution.

5.5 Hazards generated by neglecting ergonomic principles

During operation, cleaning and maintenance, there is a risk of injury or chronic damage to the body resulting from awkward body postures.

6 Safety and hygiene requirements and/or measures

6.1 Mechanical hazards

Where reference is made to interlocking devices throughout clause 6, they shall comply with clause 4.2.1 and clauses 5 and 6 of EN 1088:1995.

Safety related control systems shall be to category 1 of EN 954-1:1996.

6.1.1 Zone 1, zone 2 and zone 3

The rollers shall be fitted on both sides with guards, see figure 3, which are :

- fixed and dimensioned according to EN 294:1992 ;
- or movable and interlocking , with the following dimensions :

Table 1 : Dimensions of the guard

Dimensions in millimetres									
A max.	35	40	45	50	55	60	65	70	105
B min.	200	225	250	300	350	400	450	500	550
C min.							300	300	300
D min.	EN 294 Table 4								

iTeh STANDARD PREVIEW

The interlocking mechanism, shall be housed within the machine body or otherwise protected, to ensure that its operation is not adversely affected by for example dough or flour.

Movable interlocking guards shall be free to move at their ends furthest from the rollers in order to act like a trip device if an operator attempts to reach under any guard.

If the guard is not solid, the distance between bars or mesh shall comply with table 4 of EN 294:1992.
