IIR STANDARD PREVIEW  
 (standards.iteh.ai)  
 ISO/IEC 23009-1:2012  
<https://standards.iteh.ai/catalog/standards/sist/be022d63-ac24-4d89-9319-5fe97e3d652b/iso-iec-23009-1-2012>

## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 23009-1 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 29, *Coding of audio, picture, multimedia and hypermedia information*.

ISO/IEC 23009 consists of the following parts, under the general title *Information technology — Dynamic adaptive streaming over HTTP (DASH)*:

- *Part 1: Media presentation description and segment formats*  
<https://standards.iteh.ai/catalog/standards/sist/be022d63-ac24-4d89-9319-5fc97e3d652b/iso-iec-23009-1-2012>

## Introduction

Dynamic Adaptive Streaming over HTTP (DASH) is intended to support a media-streaming model for delivery of media content in which control lies exclusively with the client. Clients may request data using the HTTP protocol from standard web servers that have no DASH-specific capabilities. Consequently, this part of ISO/IEC 23009 focuses not on client or server procedures but on the data formats used to provide a DASH Media Presentation.

This part of ISO/IEC 23009 primarily specifies formats for the Media Presentation Description and Segments. It is applicable to streaming services over the Internet.

# Information technology — Dynamic adaptive streaming over HTTP (DASH) —

## Part 1: Media presentation description and segment formats

### 1 Scope

This part of ISO/IEC 23009 primarily specifies formats for the Media Presentation Description and Segments for dynamic adaptive streaming delivery of MPEG media over HTTP. It is applicable to streaming services over the Internet.

### 3 Terms, definitions, symbols and abbreviated terms

#### 3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

##### 3.1.1

###### **access unit**

unit of a media stream with an assigned Media Presentation time

##### 3.1.2

###### **accessibility**

degree to which a media content or certain media content components are available to as many people as possible

##### 3.1.3

###### **Adaptation Set**

set of interchangeable encoded versions of one or several media content components

##### 3.1.4

###### **available Segment**

Segment that is accessible at its assigned HTTP-URL and a possibly assigned byte range, that is the request with an HTTP GET results in a reply of the Segment and 2xx status code

<https://standards.iteh.ai/catalog/standards/sist/be022d63-ac24-4d89-9319-5fc97e3d652b/iso-iec-23009-1-2012>

##### 3.1.5

###### **Bitstream Switching Segment**

Segment that if present contains essential data to switch to the Representation it is assigned to

##### 3.1.6

###### **complementary Representation**

Representation which complements at least one dependent Representation

##### 3.1.7

###### **continuous media**

media with an inherent notion of time, for example, speech, audio, video, timed text or timed metadata

##### 3.1.8

###### **DASH metric**

metric identified by a key and defined in this part of ISO/IEC 23009

##### 3.1.9

###### **dependent Representation**

Representation for which Segments from its complementary Representations are necessary for presentation and/or decoding of the contained media content components

##### 3.1.10

###### **earliest presentation time**

smallest presentation time of any access unit of a Media Segment or Subsegment for a media stream

##### 3.1.11

###### **group**

collection of Adaptation Sets that are not expected to be presented simultaneously

**3.1.12****HTTP-URL**

URL with a fixed scheme of “http” or “https”

**3.1.13****Index Segment**

Segment that primarily contains indexing information for Media Segments

**3.1.14****Initialization Segment**

Segment containing metadata that is necessary to present the media streams encapsulated in Media Segments

**3.1.15****media content**

one media content period or a contiguous sequence of media content periods

**3.1.16****media content component**

one continuous component of the media content with an assigned media component type that can be encoded individually into a media stream

**3.1.17****media content component type**

a single type of media content such as audio, video, or text

**3.1.18****media content period**

set of media content components that have a common timeline as well as relationships on how they can be presented

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

[ISO/IEC 23009-1:2012](https://standards.iteh.ai/catalog/standards/sist/be022d63-ac24-4d89-9319-5fe97e3d652b/iso-iec-23009-1-2012)

**3.1.19****Media Presentation**

collection of data that establishes a bounded or unbounded presentation of media content

<https://standards.iteh.ai/catalog/standards/sist/be022d63-ac24-4d89-9319-5fe97e3d652b/iso-iec-23009-1-2012>

**3.1.20****Media Presentation Description****MPD**

formalized description for a Media Presentation for the purpose of providing a streaming service

**3.1.21****Media Presentation timeline**

concatenation of the timeline of all Periods which itself is common to all Representations in the Period

**3.1.22****Media Segment**

Segment that complies with media format in use and enables playback when combined with zero or more preceding segments, and an Initialization Segment (if any)

**3.1.23****media stream**

encoded version of a media content component

**3.1.24****Media Subsegment**

Subsegment that only contains media data but no Segment Index

**3.1.25**

**MPD start time**

approximate presentation start time of a Media Segment signalled in MPD

**3.1.26**

**MPD duration**

approximate presentation duration of a Media Segment signalled in MPD

**3.1.27**

**Period**

interval of the Media Presentation, where a contiguous sequence of all Periods constitutes the Media Presentation

**3.1.28**

**presentation time**

time associated to an access unit that maps it to the Media Presentation timeline

**3.1.29**

**remote element**

element that is not fully contained in the MPD document but is referenced in the MPD with an HTTP-URL

**3.1.30**

**Representation**

collection and encapsulation of one or more media streams in a delivery format and associated with descriptive metadata

iTeh STANDARD PREVIEW  
(standards.iteh.ai)

**3.1.31**

**Segment**

unit of data associated with an HTTP-URL and optionally a byte range that are specified by an MPD

**3.1.32**

**Segment availability start time**

time instant in wall-clock time at which a Segment becomes an available Segment

<https://standards.iteh.ai/catalog/standards/sist/be022d63-ac24-4d89-9319-5f697e3d652b/iso-iec-23009-1-2012>

**3.1.33**

**Segment availability end time**

time instant in wall-clock time at which a Segment ceases to be an available Segment

**3.1.34**

**Segment Index**

compact index of the time range to byte range mapping within a Media Segment separately from the MPD

**3.1.35**

**stream access point**

**SAP**

position in a Representation enabling playback of a media stream to be started using only the information contained in Representation data starting from that position onwards (preceded by initializing data in the Initialization Segment, if any)

**3.1.36**

**Sub-Representation**

part of a Representation described in the MPD that is present in the entire Period

**3.1.37**

**Subsegment**

unit within Media Segments that is indexed by a Segment Index

**3.1.38****valid Segment URL**

HTTP-URL that is promised to reference a Segment during its Segment availability period

**3.1.39****wall-clock time**

time as stated by UTC

**3.2 Symbols and abbreviated terms**

For the purposes of this document, the following symbols and abbreviated terms apply.

AVC	advanced video coding
CAT	conditional access table
DASH	dynamic adaptive streaming over HTTP
DM	DASH Metrics
DRM	digital rights management
ECM	entitlement control message
HTTP	hypertext transfer protocol
IDR	instantaneous decoding refresh
ISOBMFF	ISO base media file format
MPD	Media Presentation Description
MVC	multi-view video coding
PAT	program association table
PCR	program clock reference
PES	packetized elementary stream
PID	packet identifier
PMT	program map table
PSI	program specific information
PTS	presentation time stamp
SAP	stream access point
SEI	supplementary enhancement information
SVC	scalable video coding
TCP	transmission control protocol
TLS	transport layer security

TS	transport stream
URI	uniform resource identifier
URL	uniform resource locator
URN	uniform resource name
UTC	coordinated universal time
UUID	universally unique identifier
XML	extensible mark-up language

### 3.3 Conventions

The following naming conventions apply in this document.

- Elements in an XML document are identified by an upper-case first letter and in bold face as **Element**. To express that an element **Element1** is contained in another element **Element2**, we may write **Element2.Element1**. If an element's name consists of two or more combined words, camel-casing is typically used, e.g. **ImportantElement**. Elements may be present either exactly once, or the minimum and maximum occurrence is defined by <minOccurs> ... <maxOccurs>.
- Attributes in an XML document are identified by a lower-case first letter as well as they are preceded by a '@'-sign, e.g. @attribute. To point to a specific attribute @attribute contained in an element **Element**, one may write **Element@attribute**. If an attribute's name consists of two or more combined words, camel-casing is typically used after the first word, e.g. @veryImportantAttribute. Attributes may have assigned a status in the XML as mandatory (M), optional (O), optional with default value (OD) and conditionally mandatory (CM).
- Namespace qualification of elements and attributes is used as per XML standards, in the form of **namespace:Element** or @namespace:attribute. The fully qualified namespace will be provided in the schema fragment associated with the declaration.
- Variables defined in the context of this document are specifically highlighted with *italics*, e.g. *InternalVariable*.
- Structures that are defined as part of the hierarchical data model are identified by an upper-case first letter, e.g. Period, Adaptation Set, Representation, Segment, etc.
- The term "this clause" refers to the entire clause included within the same first heading number. The term "this subclause" refers to all text contained in the subclause with the lowest hierarchy heading.

## 4 Introduction

### 4.1 System description

Dynamic Adaptive Streaming over HTTP (DASH) specifies XML and binary formats that enable delivery of media content from standard HTTP servers to HTTP clients and enable caching of content by standard HTTP caches.

This part of ISO/IEC 23009 primarily defines two formats:

- The Media Presentation Description (MPD) describes a *Media Presentation*, i.e. a bounded or unbounded presentation of media content. In particular, it defines formats to announce resource

identifiers for *Segments* and to provide the context for these identified resources within a Media Presentation. These resource identifiers are HTTP-URLs possibly combined with a byte range.

- The Segment formats specify the formats of the entity body of the HTTP response to an HTTP GET request or a partial HTTP GET with the indicated byte range using HTTP/1.1 as defined in RFC 2616 to a resource identified in the MPD. Segments typically contain efficiently coded media data and metadata according to or aligned with common media formats.

The MPD provides sufficient information for a client to provide a streaming service to the user by accessing the Segments through the protocol specified in the scheme of the defined resources. In the context of this part of ISO/IEC 23009 the assumed protocol is HTTP/1.1. Such a client is referred to as a DASH Client in the remainder of 23009-1. However, this part of ISO/IEC 23009 does not provide a normative specification for such a client.

Figure 1 shows a possible deployment architecture in which the formats defined in this part of ISO/IEC 23009 may be used. Boxes with solid lines indicate devices that are mentioned in this specification as they host or process the formats defined in this specification whereas dashed boxes are conceptual or transparent. This part of ISO/IEC 23009 deals with the definition of formats that are accessible on the interface to the DASH Client, indicated by the solid lines. Any other formats or interfaces are not in scope of this Part of ISO/IEC 23009. In the considered deployment scenario, it is assumed that the DASH Client has access to an MPD. The MPD provides sufficient information for the DASH Client to provide a streaming service to the user by requesting Segments from an HTTP server and demultiplexing, decoding and rendering the included media streams.

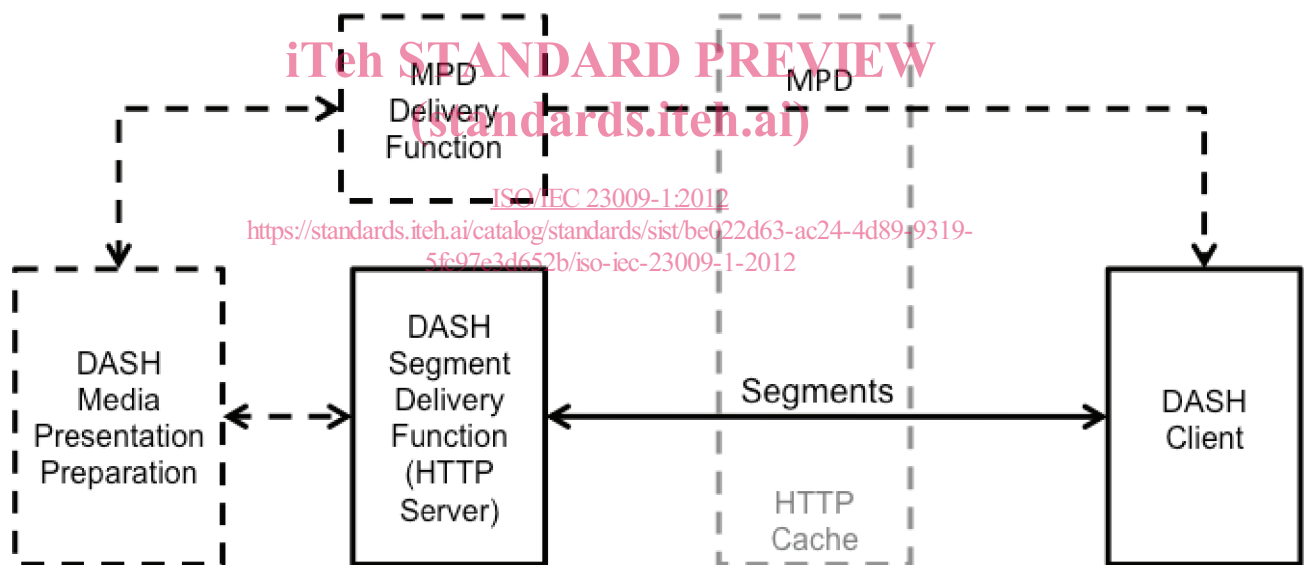

Figure 1 — Example system for DASH formats

## 4.2 DASH client model

The design of the formats defined in this part of ISO/IEC 23009 is based on the informative client model as shown in Figure 2. The figure illustrates the logical components of a conceptual DASH client model. In this figure the DASH Access Engine receives the Media Presentation Description (MPD), constructs and issues requests and receives Segments or parts of Segments. In the context of this part of ISO/IEC 23009, the output of the DASH Access Engine consists of media in MPEG container formats (ISO/IEC 14496-12 ISO Base Media File Format or ISO/IEC 13818-1 MPEG-2 Transport Stream), or parts thereof, together with timing information that maps the internal timing of the media to the timeline of the Media Presentation. In Annex F of this part of ISO/IEC 23009, guidance on enabling the use of this part of ISO/IEC 23009 with other container formats is provided.

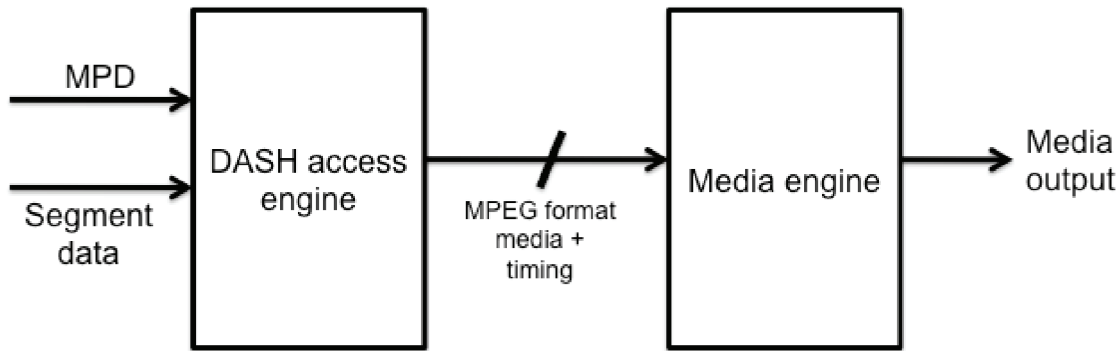

Figure 2 — DASH Client Model

### 4.3 DASH data model overview

DASH is intended to support a media-streaming model for delivery of media content in which control lies exclusively with the client. Clients may request data using the HTTP protocol from standard web servers that have no DASH-specific capabilities. Consequently, this standard focuses not on client or server procedures but on the data formats used to provide a DASH Media Presentation.

The collection of encoded and deliverable versions of media content and the appropriate description of these form a Media Presentation. Media content is composed of a single or multiple contiguous media content **periods** in time. Each media content period is composed of one or multiple **media content components**, for example audio components in various languages and a video component. Each media content component has an assigned **media content component type**, for example audio or video.

Each media content component may have several encoded versions, referred to as **media streams**. Each media stream inherits the properties of the media content, the media content period, the media content component from which it was encoded and in addition it gets assigned the properties of the encoding process such as sub-sampling, codec parameters, encoding bitrate, etc. This describing metadata is relevant for static and dynamic selection of media content components and media streams.

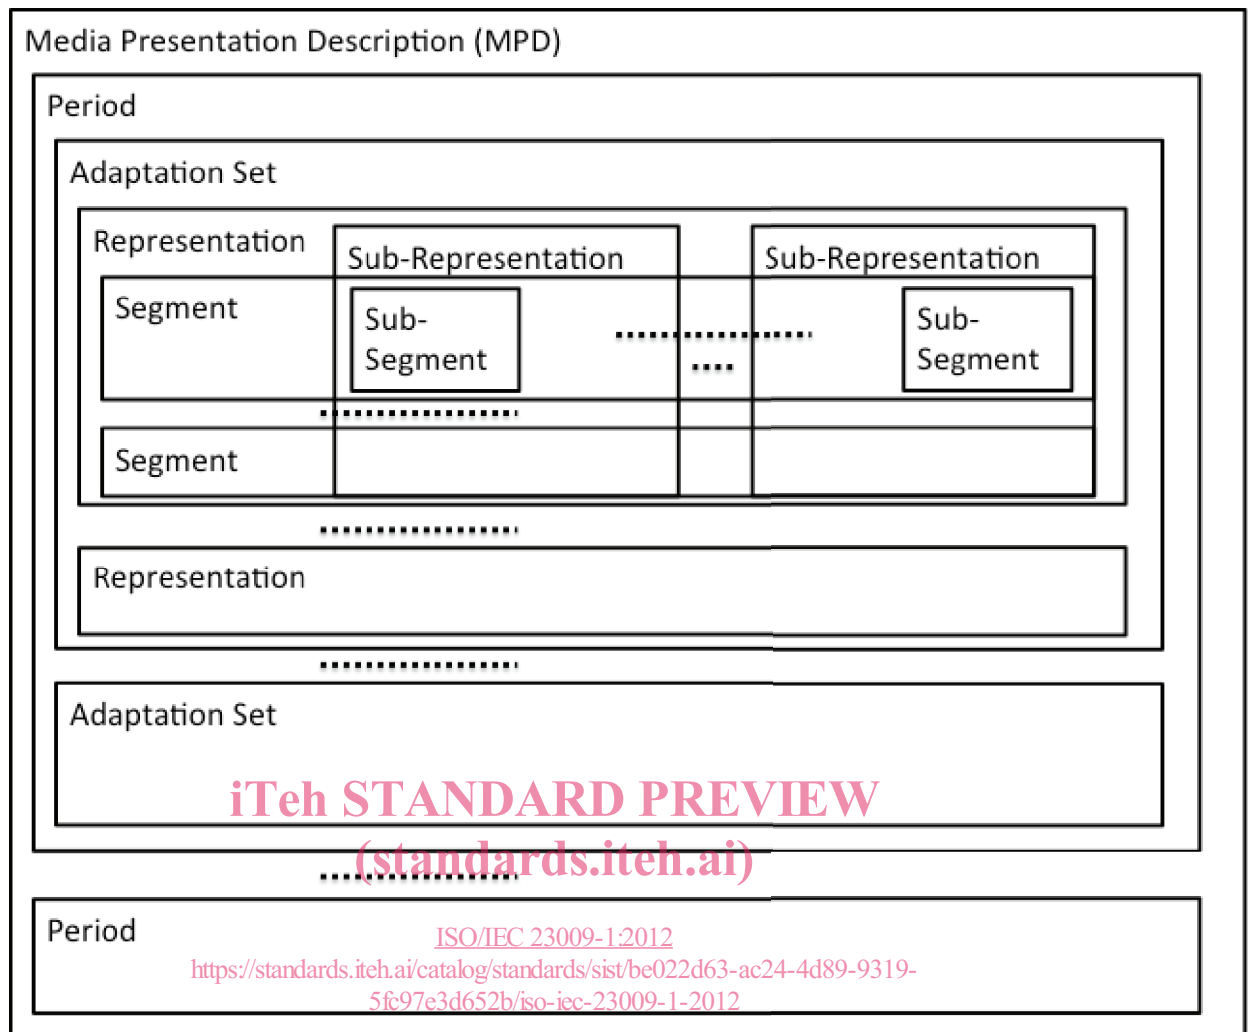

Figure 3 — DASH High-Level Data Model

DASH is based on a hierarchical data model aligned with the presentation in Figure 3. A DASH Media Presentation is described by a **Media Presentation Description** document. This describes the sequence of **Periods** (see 5.3.2) in time that make up the Media Presentation. A Period typically represents a media content period during which a consistent set of encoded versions of the media content is available i.e. the set of available bitrates, languages, captions, subtitles etc. does not change during a Period.

Within a Period, material is arranged into **Adaptation Sets** (see 5.3.3). An Adaptation Set represents a set of interchangeable encoded versions of one or several media content components (see 5.3.4). For example there may be one Adaptation Set for the main video component and a separate one for the main audio component. If there is other material available, for example captions or audio descriptions, then these may each have a separate Adaptation Set. Material may also be provided in multiplexed form, in which case interchangeable versions of the *multiplex* may be described as a single Adaptation Set, for example an Adaptation Set containing both the main audio and main video for a Period. Each of the multiplexed components may be described individually by a media content component description.

An Adaptation Set contains a set of **Representations** (see 5.3.5). A Representation describes a *deliverable encoded version* of one or several media content components. A Representation includes one or more media streams (one for each media content component in the multiplex). Any single Representation within an Adaptation Set is sufficient to render the contained media content components. Typically, clients may switch from Representation to Representation within an Adaptation Set in order to adapt to network conditions or other factors. Clients may also ignore Representations that rely on codecs or other rendering technologies they do not support or that are otherwise unsuitable.
