## Bitumen and bituminous binders - Specifications for paving grade bitumens

Bitumen und bitumenhaltige Bindemittel -  
Anforderungen an Straßenbaubitumen

This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/TC 336.

If this draft becomes a European Standard, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

**Warning** : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

<https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017>

**prEN 12591:2016 (E)****European foreword**

This document (prEN 12591:2016) has been prepared by Technical Committee CEN/TC 336 “Bituminous binders”, the secretariat of which is held by AFNOR.

This document is currently submitted to the CEN Enquiry.

This document will supersede EN 12591:2009.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association, and supports essential requirements of EU Regulation (EU) No. 305/2011.

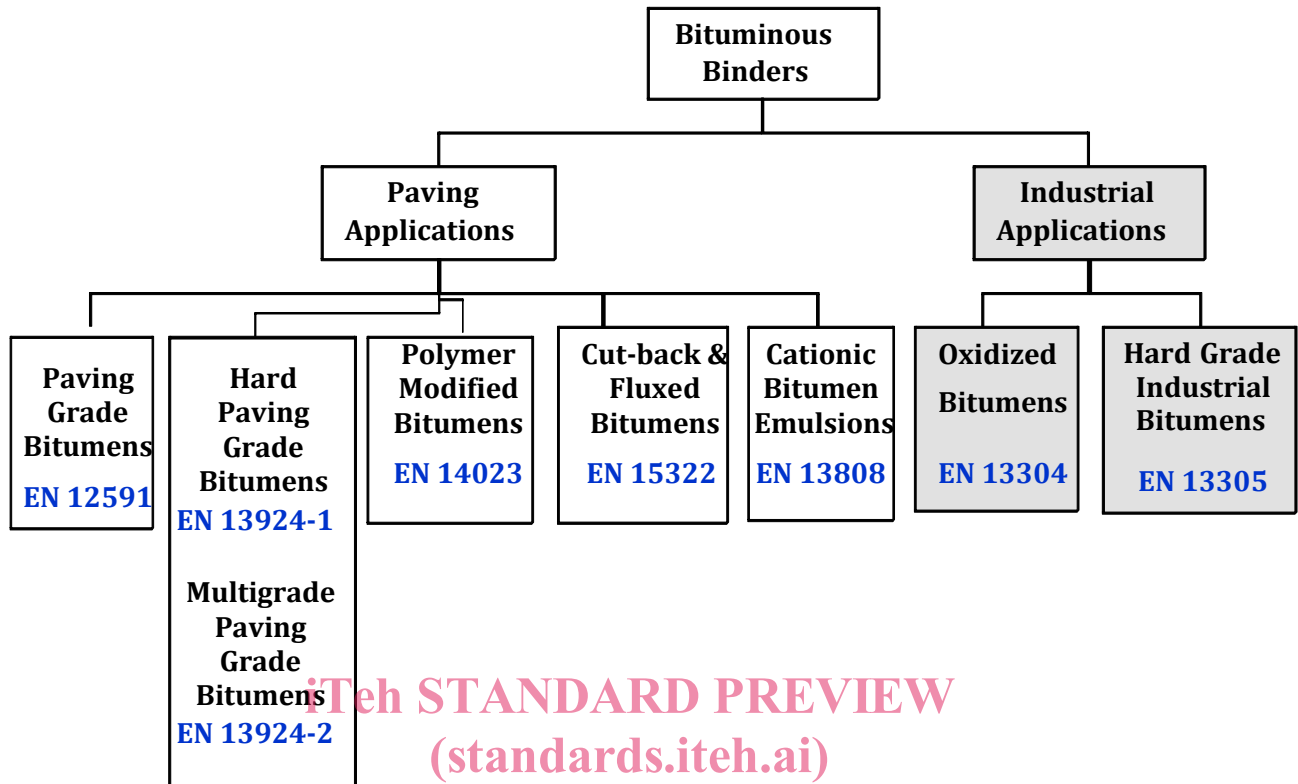

For relationship with EU Regulation (EU) No. 305/2011, see informative Annex ZA, which is an integral part of this document.

Changes to the previous edition of this standard:

- 1) addition of Subclause 5.2.8;
- 2) addition of Annex C;
- 3) addition of bitumen V9000 in Tables 3A and 3B and according change of limits for V6000 and V12000;
- 4) update of Annex ZA according to current guidance document TF N 530 Rev.2.

[ksIST prEN 12591:2017  
https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017](https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017)

This draft European Standard is part of a family of European Standards for bitumen as follows:

NOTE Industrial applications are not covered by Mandate M/124.  
<https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017>

Figure 1 — European Standards for Bitumens

## Introduction

This draft European Standard describes the performance required for a number of properties of bitumen and bituminous binders, as shown in Tables 1/2 to Tables 5/6 inclusive. Some of the properties are required by regulation in at least one EU or EFTA country (see Table ZA.1.1, Table ZA.1.2 and Table ZA.1.3) and some are included only for the benefit of industry to assist specifying appropriate performances for different end uses.

For paving grade bitumen, the testing of the following also gives an indication that its intrinsic cohesive properties are adequate for normal use.

- a) Consistency at intermediate service temperature;
- b) consistency at elevated service temperature;
- c) durability of consistency.

The properties of “adhesion” and “setting ability” are indicated by tests used on either the finished asphalt mixtures or on aggregate-bitumen combinations, i.e. EN 12697-1, EN 12697-11, EN 12697-12 and EN 12697-26 [[1], [2], [3] and [4]], rather than tests on the bitumen itself.

This draft European Standard still consists of specifications based upon traditional test methods. Work programs are being undertaken to evaluate alternative properties and test methods in order to develop new specifications that are more directly performance-related. The progress of those work programmes are reported in CEN/TR 15352 [18], and the results will be considered for future revisions of this draft European Standard.

**(standards.iteh.ai)**

<https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017>

## 1 Scope

This draft European Standard provides a framework for specifying a range of properties and relevant test methods for bitumens, which are suitable for use in the construction and maintenance of roads, airfields and other paved areas, together with requirements for evaluation of conformity.

This draft European Standard does not directly address 'cohesion, adhesion and setting ability' (see Introduction).

Although industrial bitumens are specified according to EN 13305, it should be underlined that paving grade bitumens, specified according to this draft European Standard, can also be used for industrial applications.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

**3 Terms and definitions**

For the purposes of this document, the terms and definitions given in EN 12597 apply.

**4 Sampling**

Samples of bulk products shall be taken as described in EN 58.

Test samples shall be taken from the laboratory samples, and prepared for testing, as described in EN 12594.

**5 Requirements and test methods**

[ksIST prEN 12591:2017](https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017)

**5.1 General**

<https://standards.iteh.ai/catalog/standards/sist/d348cbc9-fa20-4609-bc97-27428d6132dc/ksist-pren-12591-2017>

European product standards cover a large variety of road materials for different applications, to accommodate local traffic loads and climatic conditions. This draft European Standard therefore also covers a large range of bitumens to facilitate the production and application of the designed paving. The variety of production techniques and applications makes it more practical to split bitumens into three separate tables.

The requirements for the properties for a specific grade shall be selected from Table 1, Table 2, Table 3, Table 4, Table 5 and Table 6 by choosing a column representing the specified values or ranges.

There is a subdivision of properties into two groups in the tables. The properties in Table 1, Table 3 and Table 5 shall be specified for all paving grade bitumens. They are associated with regulatory or HSE requirements. The properties in Table 2, Table 4 and Table 6 are required to meet specific regional conditions. They are associated with regulatory or other regional requirements.

Two severity levels for resistance to hardening are stated as alternatives as, under specific conditions, a larger increase in softening point after Rolling Thin Film Oven Test (RTFOT) may be allowed (i.e. Severity level 2) without detrimental effect if this increase is associated with requirements for Fraass breaking point or penetration index ( $I_p$ ) or both.

NOTE For complementary information on grade selection, see Annex B.

## 5.2 Properties and related test methods

### 5.2.1 General

The properties of paving grade bitumens and related test methods shall be in accordance with Table 1 and Table 2, or Table 3 and Table 4 or Table 5 and Table 6. When tested by the methods given in the Tables, the various paving grades shall conform to the limits specified.

The grades are designated by the nominal penetration or viscosity ranges as appropriate.

### 5.2.2 Consistency at intermediate service temperature

Consistency at intermediate service temperature shall conform to the requirements for penetration value in Table 1 or Table 3.

### 5.2.3 Consistency at elevated service temperature

Consistency at elevated service temperature shall conform to the requirements for softening point in Table 1 (penetration graded), softening point or dynamic viscosity in Table 3 (penetration graded), or kinematic viscosity in Table 5 (kinematic viscosity graded).

### 5.2.4 Brittleness at low service temperature

Brittleness at low service temperature may be required to meet specific regional conditions in countries susceptible to extreme cold. Where required, paving grade bitumens shall conform to the requirements for Fraass breaking point in Table 2 or Table 4.

### 5.2.5 Temperature dependence of consistency

Temperature dependence of consistency may be required to meet specific regional conditions. Where required, paving grade bitumens shall conform to the requirement for dynamic viscosity or penetration index ( $I_p$ ) or both in Table 2.

### 5.2.6 Durability - Resistance to hardening

Durability is demonstrated by compliance with the required surrogate characteristics of "Resistance to hardening", defined in Table 1, Table 3 or Table 6.

Resistance to hardening shall be tested according to the Rolling Thin Film Oven Test (RTFOT) in accordance with EN 12607-1 for binders from Table 1 and Table 3.

Resistance to hardening shall be tested according to the Thin Film Oven Test (TFOT) in accordance with EN 12607-2 for binders from Table 5.

### 5.2.7 Other properties

#### 5.2.7.1 Density

Although requirements for the density of paving grade bitumens are not given in this document, density shall be determined, when necessary, in accordance with EN 15326.

#### 5.2.7.2 Flash point

Flash point shall be determined by the Cleveland open cup method in EN ISO 2592 for binders in Table 1 and by the Pensky-Martens closed cup method, EN ISO 2719, for binders in Table 3 and Table 5.

For bitumens in Table 1, the Pensky-Martens closed cup method may be used to investigate possible contamination but is likely to give lower values than the Cleveland open cup method.

**prEN 12591:2016 (E)****5.2.8 Informative properties**

Annex C lists the informative properties which suppliers of paving grade bitumen shall make available as “Reported Values”.

**5.3 Release of dangerous regulated substances**

National regulations on dangerous substances may require verification and declaration on release, and sometimes content, when construction products covered by this standard are placed on those markets. In the absence of European harmonized test methods, verification and declaration on release/content should be done taking into account national provisions in the place of use.

NOTE An informative database covering European and national provisions on dangerous substances is available at the Construction website on EUROPA accessed through: <http://ec.europa.eu/enterprise/construction/cpd-ds/>.

**5.4 Precision**

The test methods referred to in this document include precision statements when available. In cases of uncertainty, the procedures described in EN ISO 4259 for interpretation of the results based on test method precision shall be used.
