Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Foreword

This Group Specification (GS) has been produced by ETSI Industry Specification Group (ISG) Multi-access Edge Computing (MEC).

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

1 Scope

The present document defines design principles for RESTful MEC service APIs, provides guidelines and templates for the documentation of these, and defines patterns of how MEC service APIs use RESTful principles.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <https://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

[1] IETF RFC 7231: "Hypertext Transfer Protocol (HTTP/1.1): Semantics and Content".

NOTE: Available at <https://tools.ietf.org/html/rfc7231>.

3 Definition of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the terms given in ETSI GS MEC 001 [i.1] and the following apply:

resource: object with a type, associated data, a set of methods that operate on it, and, if applicable, relationships to other resources

NOTE: A resource is a fundamental concept in a RESTful API. Resources are acted upon by the RESTful API using the Methods (e.g. POST, GET, PUT, DELETE, etc.). Operations on Resources affect the state of the corresponding managed entities.

3.2 Symbols

Void.

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in ETSI GS MEC 001 [i.1] and the following apply:

API	Application Programming Interface
BYOT	Bring Your Own Transport
CRUD	Create, Read, Update, Delete
DDoS	Distributed Denial of Service
GS	Group Specification
HATEOAS	Hypermedia As The Engine Of Application State
HTTP	Hypertext Transfer Protocol
HTTPS	HTTP Secure
IANA	Internet Assigned Numbers Authority
IETF	Internet Engineering Task Force
ISG	Industry Specification Group
JSON	JavaScript Object Notation
MEC	Multi-access Edge Computing
POX	Plain Old XML
REST	Representational State Transfer
RFC	Request For Comments
RPC	Remote Procedure Call
TCP	Transmission Control Protocol
TLS	Transport Layer Security
UE	User Equipment
URI	Uniform Resource Indicator
XML	eXtensible Markup Language

4 Design principles for developing RESTful MEC service APIs

4.1 REST implementation levels

The Richardson Maturity Model as defined in [i.3] breaks down the principal elements of a REST approach into three steps.

All RESTful MEC service APIs shall implement at least Level 2 of the Richardson Maturity Model explained in annex C.

It is recommended to implement Level 3 when applicable.

4.2 General principles

RESTful MEC service APIs are not technology implementation dependent.

RESTful MEC service APIs embrace all aspects of HTTP/1.1 (IETF RFC 7231 [1]) including its request methods, response codes, and HTTP headers. Support for PATCH (IETF RFC 5789 [3]) is optional.

For each RESTful MEC service API specification, the following information should be included:

- Purpose of the API.
- URIs of resources including version number.
- HTTP methods (IETF RFC 7231 [1]) supported.
- Representations supported: JSON and, if applicable, XML.
- Response schema(s).
- Request schema(s) when PUT, POST, or PATCH are supported.
- Links supported (Optional in Level 2 APIs).
- Response status codes supported.

Since the release of HTTP/1.1, major revisions have been introduced through HTTP/2 (IETF RFC 7540 [18]) including binary serialization in place of textual, single TCP connection, full multiplexing, header compression and server push. MEC system deployments may utilize HTTP/2. However, this is transparent to the RESTful MEC service APIs, as the main semantic of HTTP has been retained in HTTP/2 thereby providing backwards compatibility. If HTTP/2 (IETF RFC 7540 [18]) is supported, its use shall be negotiated as specified in section 3 of IETF RFC 7540 [18].

4.3 Entry point of a RESTful MEC service API

Entry point for a RESTful MEC service API:

- Needs to have one and exactly one entry point. The URI of the entry point needs to be communicated to API clients so that they can find the API.
- It is common for the entry point to contain some or all of the following information:
 - Information on API version, supported features, etc.
 - A list of top-level collections.
 - A list of singleton resources.
 - Any other information that the API designer deemed useful, for example a small summary of operating status, statistics, etc.
- It can be made known via different means:
 - Client discovers automatically the entry point and meaning of the API.
 - Client developer knows about the API at time of client development.

4.4 API security and privacy considerations

To allow proactive protection of the APIs against the known security and privacy issues, e.g. DDoS, frequency attack, unintended or accidental information disclosure, etc. the design for a secure API should consider at least the following aspects:

- Ability to control the frequency of the API calls (calls/min), e.g. by supporting the definition of a validity time or expiration time for a service response.
- Anonymization of the real identities.
- Authorization of the applications based on the sensitivity of the information exposed through the API.

5 Documenting RESTful MEC service APIs

5.1 RESTful MEC service API template

Annex D defines a template for the documentation of RESTful MEC service APIs. Examples how to use this template can for instance be found in ETSI GS MEC 011 [i.6] and ETSI GS MEC 012 [i.7].

5.2 Conventions for names

5.2.1 Case conventions

The following case conventions for names and strings are used in the RESTful MEC service APIs:

1) UPPER_WITH_UNDERSCORE

All letters of a string are capital letters. Digits are allowed but not at the first position. Word boundaries are represented by the underscore "_" character. No other characters are allowed.

EXAMPLE 1:

- ETSI_MEC_MANAGEMENT;
- MULTI_ACCESS_EDGE_COMPUTING.

2) lower_with_underscore

All letters of a string are lowercase letters. Digits are allowed but not at the first position. Word boundaries are represented by the underscore "_" character. No other characters are allowed.

EXAMPLE 2:

- etsi_mec_management;
- multi_access_edge_computing.

3) UpperCamel

A string is formed by concatenating words. Each word starts with an uppercase letter (this implies that the string starts with an uppercase letter). All other letters are lowercase letters. Digits are allowed but not at the first position. No other characters are allowed. Abbreviations follow the same scheme (i.e. first letter uppercase, all other letters lowercase).

EXAMPLE 3:

- EtsiMecManagement;
- MultiAccessEdgeComputing.

4) lowerCamel

As UpperCamel, but with the following change: The first letter of a string shall be lowercase (i.e. the first word starts with a lowercase letter).

EXAMPLE 4:

- a) etsiMecManagement;
- b) multiAccessEdgeComputing.

5.2.2 Conventions for URI parts

5.2.2.1 Introduction

Based on IETF RFC 3986 [9], the parts of the URI syntax that are relevant in the context of the RESTful MEC service APIs are as follows:

- *Path*, consisting of *segments*, separated by "/" (e.g. segment1/segment2/segment3).
- *Query*, consisting of pairs of parameter name and value (e.g. ?org=etsi&isg=mec, where two pairs are presented).

5.2.2.2 Path segment naming conventions

- a) Each path segment of a resource URI which represents a constant string shall use lower_with_underscore. Only letters, digits and underscore "_" are allowed.

EXAMPLE 1: etsi_mec_management

- b) If a resource represents a collection of entities, and the last path segment of that resource's URI is a string constant, the last path segment shall be plural.

EXAMPLE 2: .../prefix/api/v1/users

- c) If a resource is not a task resource and the last path segment of that resource's URI is a string constant, the last path segment should be a (composite) noun.

EXAMPLE 3: .../prefix/api/v1/users

- d) For resources that are task resources, the last path segment of the resource URI should be a verb, or at least start with a verb.

EXAMPLE 4:

.../app_instances/{appInstanceId}/instantiate

.../app_instances/{appInstanceId}/do_something_else

- e) A name that represents a URI path segment or multiple URI path segments in the API documentation but serves as a placeholder for an actual value created at runtime (URI path variable) shall use lowerCamel, and shall be surrounded by curly brackets.

EXAMPLE 5: {appInstanceId}

- f) Once a variable is replaced at runtime by an actual string, the string shall follow the rules for a path segment or sequence of path segments (depending on whether the variable represents a single path segment or a sequence thereof) defined in IETF RFC 3986 [9]. IETF RFC 3986 [9] disallows certain characters from use in a path segment. Each actual RESTful MEC service API specification shall define this restriction to be followed when generating values for path segment variables, or propose a suitable encoding (such as percent-encoding according to IETF RFC 3986 [9]), to escape such characters if they can appear in input strings intended to be substituted for a path segment variable.
