Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 30004 was prepared by Technical Committee ISO/TC 8, *Ships and marine technology*.

This first edition of ISO 30004 cancels and replaces ISO/PAS 30004:2011, which has been technically revised.

iTeh STANDARD PREVIEW (standards.iteh.ai)

ISO 30004:2012

<https://standards.iteh.ai/catalog/standards/sist/f890dbc0-1d83-4733-89bb-d3f44b624ab0/iso-30004-2012>

Introduction

This International Standard has been developed in response to demand from industry for a ship recycling standard.

As concern grows for identifying essential elements required for a ship recycling facility, shipowners, ship recyclers, governments, concerned bodies and other stakeholders are increasingly looking for guidance in what is acceptable in implementing standards for ship recycling facilities.

There is recognition that the present levels of death and injury, damage to the environment, lack of sanitation and provision of basic welfare needs are unacceptable. However, there is a lack of clear guidance on what is the minimum standard required.

This International Standard aims to identify the principal elements required for compliance with ISO 30000. It not only gives guidance on how to design the management system in compliance with ISO 30000, but also leads the designer or auditor into what the practical item's consequences should be.

This International Standard describes the principal functional requirements of a ship recycling facility and the elements of the management system, and gives facilities guidance on how to establish, implement, maintain and improve a ship recycling facility management system.

Practical examples are presented throughout this International Standard for illustrative purposes. They are not intended to present the only possibilities, nor are they necessarily suitable for every organization. In designing and implementing ISO 30000, an organization should select approaches that are appropriate to their own situation.

For ease of reading and understanding this International Standard, practical help and general guidance have been separated and are shown as boxed text.

Within some organizations, elements of the ship recycling management system may already be in place, such as the policy and risk assessment records, but others will probably need to be developed further. Some organizations will have an integrated system in place which includes elements that have common requirements to those identified in this International Standard. Many organizations will already have systems and may decide to develop an integrated system that complies with ISO 30000. Compatible standards such as ISO 9001, ISO 14001 and OHSAS 18001 are particularly relevant to this approach and ISO 30000 is designed to ease such integration.

The organization should establish, document, implement, maintain and continually improve a ship recycling management system in accordance with this International Standard.

“Establish” implies a level of permanency and the system should not be considered established until all of its elements have been demonstrably implemented.

“Maintain” implies that, once established, the system continues to operate effectively. This requires active involvement on the part of the organization. Many systems start well but deteriorate due to lack of maintenance. Many of the elements of this International Standard (such as checking and performance review) are designed to ensure active maintenance of the system.

It is important that all the elements in this International Standard be incorporated into the ship recycling management system, but the manner and extent to which individual elements should be applied will depend on factors such as the size of the organization, the nature of its activities, the hazards, the risks, the environment and the conditions in which it operates.

Managers of ship recycling facilities who wish to establish, implement, maintain or improve a management system for their facility need to:

- recognize that the environment, safety, health and welfare are among the highest organizational priorities;
- establish and maintain communication and constructive relations with internal and external interested parties including stakeholders, shipowners and the general public;
- identify the important aspects of the facility's operations including procedures for accepting the ship and downstream waste management (i.e. activities before and after operations in the facility itself) ;

- identify the legal requirements and other requirements to which the organization subscribes, that relate to the aspects above. These include national and international law such as the IMO Convention and requirements of the Basel Convention, the International Labour Organization (ILO) and other competent International organizations, as well as relevant guidelines published by these or other recognized organizations;
- ensure the commitment of management and all persons working for or on behalf of the organization to the protection of the environment and the safety, health and welfare of all persons whom the organization can control or exert influence over, with clear assignment of accountability and responsibility;
- encourage planning throughout the activities of the facility, and related upstream and downstream activities;
- establish a process for achieving necessary objectives and targets;
- provide appropriate and sufficient resources, including training, to comply with applicable legal and other requirements to which the facility subscribes and to monitor and achieve the objectives and targets on an ongoing basis;
- evaluate environmental, safety, health and welfare performance against the facility's policy, objectives and targets and seek improvement where appropriate;
- establish a management process to audit and review the system and to identify its opportunities for improvement and resulting environmental, safety, health and welfare performance, and
- encourage subcontractors, suppliers, transporters, disposers, re-sellers and other stakeholders to establish similar systems to manage and improve environmental, safety, health and welfare performance.

iteh STANDARD PREVIEW
(standards.iteh.ai)

Facilities may use this International Standard, or related ISO documents, in various ways, including:

- as guidance to establish, implement, maintain or improve its management system, knowing that this International Standard is not intended for conformity assessment purposes, and
- in support of the implementation or improvement of its ship recycling management system.

ISO 30004:2012

Implementation or improvement of its ship recycling management system.

d3f44b624ab0/iso-30004-2012

The choice will depend on factors such as:

- the facility's goals;
- the maturity of the facility's management systems;
- possible advantages and disadvantages, as determined by such factors as the facility's current and desired market position, reputation, external relations and the views of interested parties, and
- the size of the organization.

An effective ship recycling management system helps an organization to avoid, reduce, control or mitigate the adverse impacts of its activities and to achieve compliance with applicable legal requirements as well as other requirements to which the organization subscribes; this should in particular include national and international law, the IMO convention and the relevant guidelines issued by the IMO, the Basel Convention and the ILO.

Having a ship recycling facility management system can help a facility assure shipowners and other interested parties that:

- a management commitment exists for environmental concerns, the safety, health and welfare of workers and to meet its policy, objectives and targets;
- legal compliance (international and national) is ensured as well as compliance with IMO, Basel Convention and ILO guidance;
- emphasis is placed on prevention of accidents and incidents;
- evidence of reasonable care and regulatory compliance can be provided as well as the proper acknowledgement and implementation of at least IMO, Basel Convention and ILO guidance, and

- the systems design incorporates the process of continual improvement.

NOTE This International Standard is based on the methodology known as Plan-Do-Check-Act (PDCA).

PDCA can be described as follows:

- Plan: establish the objectives and processes necessary to deliver results in accordance with the organization's ship recycling policy;
- Do: implement the processes;
- Check: monitor and measure processes against recycling policy, objectives, targets, legal and other requirements, and report results, and
- Act: take actions to continually improve performance of the recycling management system.

Ships and marine technology — Ship recycling management systems — Guidelines for the implementation of ISO 30000

1 Scope

This International Standard provides generic advice on the application of ISO 30000:2009.

It explains the underlying principles of ISO 30000 and describes the intent, typical inputs, processes and typical outputs, for each requirement of ISO 30000. This is to aid in the understanding and implementation of ISO 30000.

This International Standard does not create additional requirements to those specified in ISO 30000, nor does it prescribe mandatory approaches to the implementation of ISO 30000.

NOTE Occupational health and safety issues may be included when an organization seeks to implement an integrated environmental and occupational health and safety management system.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 30000, *Ships and marine technology — Ship recycling management systems — Specifications for management systems for safe and environmentally sound ship recycling facilities*

[ISO 30004:2012](https://standards.iteh.ai/catalog/standards/sist/f890dbc0-1d83-4733-89bb-d3f44b624ab0/iso-30004-2012)

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

acceptable risk

risk that has been reduced to a level that can be tolerated by the organization with regard to its legal obligations and its ship recycling policy

3.2

performance indicator (environmental, safety, management, welfare)

EPI, SPI, MPI, WPI

item that provides information or a measure about the facility or an organization's performance in the stated field

3.3

correction

action taken to eliminate a detected nonconformity

3.4

hazard

source, situation or act with a potential for harm in terms of human injury or ill health (both short- and long-term), damage to property, damage to the environment, or a combination of these

3.5

ill health

identifiable, adverse physical or mental condition arising from and/or made worse by a work activity and/or work-related situation

**3.6
incident**

work-related event(s) in which a negative effect on ship recycling aspects or impacts, whether related to safety, health, welfare or the environment (regardless of severity), occurred or could have occurred, whether short-term or long-term

NOTE 1 An accident is an incident which has given rise to actual negative effects, such as injury, ill health, fatality, permanently reduced circumstances.

NOTE 2 An incident where no negative effects occur may be referred to as a “near miss”, “near hit”, “close call” or “dangerous occurrence”.

NOTE 3 An emergency situation is a particular type of incident.

**3.7
risk**

combination of the likelihood of an occurrence of a hazardous event or exposure(s) and the severity of the incident caused

**3.8
risk assessment**

process of evaluating the risk(s) arising from a hazard, taking into account the adequacy of any existing controls, and deciding whether or not the risk(s) is acceptable

4 Ship recycling management system elements

ITeH STANDARD PREVIEW
(standards.iteh.ai)

4.1 General

4.1.1 The ship recycling management system model

The management system detailed in this International Standard follows a “Plan-Do-Check-Act” (PDCA) management model. This model and the ongoing process of continual improvement are illustrated in the boxed text in this subclause.

A ship recycling management system is best viewed as an organizing framework that should be continually monitored and periodically reviewed to provide effective direction for an organization’s management in response to changing internal and external factors. All levels in the organization should accept responsibility for working to achieve improvements in the management system, as applicable.

When first establishing a management system, an organization should begin where there is obvious benefit, for example by focusing on immediate safety benefits or regulatory compliance related to its most significant recycling aspects. As the management system takes shape, procedures, programmes and technologies can be put in place to further improve the facility’s performance. It should be noted that relevant guidance from organizations such as the ILO and the Basel Convention give guidance in such staged improvements.

Practical help — The ship recycling system management model

PDCA is an ongoing, iterative process that enables an organization to establish, implement and maintain its ship recycling policy based on top management's leadership and commitment to the management system. After the organization has evaluated its current position in relation to its activities for safety, health, welfare and the environment, the steps of this ongoing process are the following:

- a) Plan: manage and organize the tasks and operations through required procedures and practices so that the aspects and impacts are properly controlled:
 - 1) identify ship recycling aspects and associated ship recycling impacts (see 4.3.1);
 - 2) identify and monitor applicable legal requirements and other requirements to which the organization subscribes, and set internal performance criteria where appropriate (see 4.3.2);
 - 3) set ship recycling objectives and targets and formulate programme(s) to achieve them (see 4.3.3.1 and 4.3.3.2); and
 - 4) develop and use performance indicators (see 4.3.3.3).
- b) Do: implement and operate the ship recycling management system (see 4.4):
 - 1) create management structures, assign roles and responsibilities with sufficient authority;
 - 2) provide adequate resources (see 4.4.1);
 - 3) train persons working for or on behalf of the organization and ensure their awareness and competence (see 4.4.2);
 - 4) establish processes for internal and external communication (see 4.4.3);
 - 5) establish and maintain documentation (see 4.4.4);
 - 6) establish and implement document control(s) (see 4.4.5);
 - 7) establish and maintain operational control(s) (see 4.4.6); and
 - 8) ensure emergency preparedness and response (see 4.4.7).
- c) Check: assess ship recycling management system processes (see 4.5):
 - 1) conducting ongoing monitoring and measurement (see 4.5 and 4.5.1);
 - 2) evaluate status of compliance (see 4.5.2);
 - 3) identify nonconformity and take corrective and preventive actions (see 4.5.3);
 - 4) manage records (see 4.5.4); and
 - 5) conduct periodic internal audits (see 4.5.5).
- d) Act: review and take action to improve the ship recycling management system (see 4.6):
 - 1) conduct management reviews of the ship recycling management system at appropriate intervals (see 4.6.1); and
 - 2) identify areas for improvement (see 4.6.2).

This ongoing process enables the organization to continually improve its ship recycling management system and its overall ship recycling performance.

4.1.2 Top management commitment and leadership

To ensure success, an early step in establishing or improving a management system involves obtaining commitment from the top management of the organization to improve the management of its activities, products, services, and suppliers. The ongoing commitment and leadership of the top management are crucial. Identifying the benefits that a ship recycling management system can bring, as well as the challenges that a management system can avoid, may help to secure top management's commitment and leadership.

4.1.3 Scope of the ship recycling management system

Top management needs to define the scope of the organization's management system. ISO 30000 is designed to be all inclusive in order to allow top management to visibly control all the processes and procedures it needs to. This is particularly true in the case of downstream waste management and also with the processes for accepting ships into the facility as well as the use and control of contracted or subcontracted organizations throughout the processes involved. Therefore top management should clearly define these boundaries. Once

the scope has been defined, all activities, products, services, subcontractors, suppliers and subsuppliers within the scope should be covered by the management system. Further, it should be noted that since the design of the facility is critical to its success, the design and infrastructure of the facility, its suppliers and subcontractors need to be within the scope.

4.1.4 Initial ship recycling status review

An organization with no existing management system, or with a management system which has not previously been assessed against ISO 30000, should assess its current position by a review. This review should cover all the safety welfare and environmental aspects of all the facility's activities within its scope, including procedures for vessel arrivals, management of subcontractors on site, transport, disposal and other downstream waste management.

Where no formal management system exists, or if the organization is newly established, the initial status review should serve as a basis for establishing what arrangements should be made to ensure an effective management system is implemented. The initial status review should indicate where the organization currently stands in relation to managing its ship recycling aspects and associated risks.

The review should cover the following key areas:

- a) identification and assessment of safety, hazards, welfare and environmental aspects, including upstream management (import/export and acceptance of the ship), site activities and subcontractors on site, transport and downstream waste management. Each element should be examined for normal operating conditions, abnormal conditions including start up and shut down, and emergency situations, pollution incidents and accidents;
- b) the relevant infrastructure and facilities of the site, and all associated subcontractors, suppliers and other facilities providing vital services such as transport and disposal should be examined for adequacy, as well as the procedural and legal capability of supporting services for certification and compliance;
- c) identification of applicable legal requirements, both national and international and other requirements to which the organization or its suppliers subscribes, such as guidance published by IMO, ILO and the Basel Convention as well as industry best practice;
- d) examination of existing management practices and procedures, including those associated with procurement and contracting activities; and
- e) evaluation of past emergency situations and accidents.

The review can also include additional considerations, such as:

- an evaluation of performance compared with applicable internal criteria, external standards, regulations, codes of practice, and sets of principles and guidelines;
- opportunities for competitive advantage, including cost reduction opportunities;
- the views of interested parties; and
- other organizational systems that can enable or impede environmental performance.

The results of the review should be documented and can be used to assist the organization in setting the scope of its ship recycling management system, developing or enhancing its policy, setting its objectives and targets, and determining the effectiveness of its approach to maintaining compliance with applicable legal requirements and other requirements to which the organization subscribes. The results can also be used as applicable to form a baseline for continuous improvement.

Practical help — Initial review

Methods that can be used to examine existing management practices and procedures include:

- a) interviews with persons previously or currently working for or on behalf of the organization to determine the scope of the organization's past and current activities, products and services;
- b) evaluation of internal and external communications that have taken place with the organization's interested parties, including complaints, matters related to applicable legal requirements or other requirements to which the organization subscribes, past environmental or related incidents and accidents;
- c) gathering information related to current ship recycling practices such as:
 - 1) current guidance such as published by IMO, ILO and the Basel Convention as well as local information such as legislation and recent legal developments;
 - 2) flag state and national authority advice on documents, reporting and procedures for preparing and delivering ships to be recycled, especially regarding Inventories of Hazardous Materials and Ship Recycling plans and export/import requirements and notifications;
 - 3) national authority requirements for ship recycling facilities;
 - 4) owner's specific requirements for recycling of their ships;
 - 5) best practice guidance;
 - 6) requirements for handling hazardous materials;
 - 7) information on ship dismantling procedures and practices;
 - 8) methods for protecting land, sea, and air from harmful emissions due to ship recycling processes;
 - 9) safety procedures for ship recycling, especially with regard to safe entry, hot work, working at heights, required personal protective equipment (PPE), recognizing hazards, training, awareness, etc;
 - 10) storage, transport and disposal of hazardous materials;
 - 11) control of subcontractors and suppliers;
 - 12) prevention of pollution;
 - 13) welfare practices and provisions of essential services in the facility such as messes, changing facilities, sanitation, etc;
 - 14) welfare provisions external to the facility such as housing, hospitals, schools, recreation, shops, financial services, emergency services, road rail and other communication, etc;
 - 15) emergency preparedness and response;
 - 16) training programmes;
 - 17) review and approval processes for operational control procedures;
 - 18) completeness of monitoring records and/or ease of retrieving historical records; and
 - 19) reporting procedures.

The review can be conducted using checklists, process flowcharts, interviews, direct inspection and past and current measurements, results of previous audits or other reviews. The results of the review should be documented so that it can be used to contribute to setting the scope and establishing or enhancing the organization's ship recycling management system, including its ship recycling policy.

4.2 Ship recycling policy

The ship recycling policy establishes the basic management policy of the ship recycling facility with regard to safety, health, welfare and the environment. It is expected to be complementary to any business or other policies the organization may have.

The policy sets the level of safety, health, welfare and environmental performance and responsibility required of the organization, against which all subsequent actions will be judged.

The policy should be appropriate to the impacts of the facility's operations and should guide the setting of objectives and targets. It should be reviewed periodically to ensure it remains relevant and appropriate, and takes into account any changes to the organization or its operations.
