

Designation: D6822 – 02 (Reapproved 2008)

Designation: Manual of Petroleum Measurement Standards (MPMS), Chapter 9.3

# Standard Test Method for Density, Relative Density, and API Gravity of Crude Petroleum and Liquid Petroleum Products by Thermohydrometer Method<sup>1</sup>

This standard is issued under the fixed designation D6822; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

# 1. Scope

1.1 This test method covers the determination, using a glass thermohydrometer, of the density, relative density (specific gravity), or API gravity of crude petroleum and liquid petroleum products with Reid vapor pressures of 101.325 kPa (14.696 psi) or less. Values are determined at existing temperatures and corrected to  $15^{\circ}$ C or  $60^{\circ}$ F by means of international standard tables.

1.2 The values stated in either SI units or inch pound-units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the standard.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

# 3. Terminology

#### 3.1 Definitions of Terms Specific to This Standard:

3.1.1 API gravity (°API), n—a special function of relative density 60/60°F, represented by:

 $^{\circ}API = [141.5 / (relative density 60/60^{\circ}F)] - 131.5$  (1)

3.1.1.1 *Discussion*—No statement of reference temperature is required, as  $60^{\circ}$ F is included in the definition.

3.1.2 *density*, n—the mass of liquid per unit volume at 15°C and 101.325 kPa with the standard unit of measurement being kilograms per cubic metre (kg/m<sup>3</sup>).

3.1.2.1 *Discussion*—Other reference temperatures, such as 20°C may be used for some products or in some locations. Less preferred units of measurement; for example, kg/L or g/mL, are still in use.

3.1.3 *observed values*, *n*—hydrometer readings observed at a temperature other than the defined reference temperature.

3.1.3.1 *Discussion*—These values are only hydrometer readings and not density, relative density, or API gravity at the temperature.

3.1.4 *relative density*, *n*—the ratio of the mass of a given volume of liquid at a specific temperature to the mass of an equal volume of pure water at the same or different temperature. Both reference temperatures shall be explicitly stated.

3.1.4.1 *Discussion*—Common reference temperatures include 15/15°C, 60/60°F, 20/20°C, and 20/4°C. The historic term specific gravity may still be found.

3.1.5 *thermohydrometer*, *n*—a glass hydrometer with a self-contained thermometer.

#### 4. Summary of Test Method

4.1 The density or API gravity, after temperature equilibrium has been reached, is read by observing the freely floating thermohydrometer and noting the graduation nearest to the apparent intersection of the horizontal plane surface of the liquid with the vertical scale of the hydrometer after temperature equilibrium has been reached. The observed thermohydrometer reading is reduced to the reference temperature value by means of the Petroleum Measurement Tables (the appropriate adjunct to Guide /API *MPMS* Chapter 11.1) and observed temperature from the enclosed thermometer.

#### 5. Significance and Use

5.1 Density and API gravity are used in custody transfer quantity calculations and to satisfy transportation, storage, and regulatory requirements. Accurate determination of density or API gravity of crude petroleum and liquid petroleum products is necessary for the conversion of measured volumes to volumes at the standard temperatures of 15°C or 60°F. 5.2 Density and API gravity are also factors that indicate the quality of crude petroleum. Crude petroleum prices are frequently posted against values in kg/m<sup>3</sup> or in degrees API. However, this property of petroleum is an uncertain indication of its quality unless correlated with other properties.

5.3 *Field of Application*—Because the thermohydrometer incorporates both the hydrometer and thermometer in one device, it is more applicable in field operations for determining density or API gravity of crude petroleum and other liquid petroleum products. The procedure is convenient for gathering main trunk pipelines and other field applications where limited laboratory facilities are available. The thermohydrometer method may have limitations in some petroleum density determinations. When this is the case, other methods such as Test Method D1298 (API *MPMS* Chapter 9.1) may be used.

5.4 This test method is suitable for determining the density, relative density, or API gravity of low viscosity transparent or opaque liquids, or both. This test method, when used for opaque liquids, requires the use of a meniscus correction (see 7.2).

# 6. Apparatus

6.1 *Glass Thermohydrometers*, as specified in Specification E100 (shown in Fig. 1), and graduated in:

| ASTM Hydrometer No.   | Density, Range, kg/m <sup>3</sup> |  |  |  |
|---|-----------------------------------|--|--|--|
| 300H  | 600 to 650                        |  |  |  |

6.1.1 Kilograms/cubic metre  $(kg/m^3)$  and degrees Celsius for density hydrometers, as shown in Table 1.

6-6.1.2 Degrees API (°API) and degrees Fahrenheit for hydrometers measuring in API Gravity, as shown in Table 2.

6.2 *Hydrometer Cylinders*, clear glass, plastic, or metal. For convenience of pouring, the cylinder may have a pouring lip. The inside diameter shall be at least 25 mm (1 in.) greater than the outside diameter of the thermohydrometer used. The height of the cylinder shall be such that the bottom of the thermohydrometer clears the bottom of the cylinder by at least 25 mm (1 in.) when suspended in the sample test portion.

6.2.1 For field testing, a sample thief of suitable dimensions may be more convenient than a hydrometer cylinder. The liquid level shall be level with the top of the thief.

6.3 *Temperature Bath*, to control temperature close to the bulk hydrocarbon temperature or to control temperature close to the reference temperature of  $15^{\circ}$ C or  $60^{\circ}$ F.

# 7. Procedure

7.1 Effect of Test Temperature:

7.1.1 The density or API gravity determined by the thermohydrometer method is most accurate at or near the reference temperature of  $15^{\circ}$ C or  $60^{\circ}$ F. Other temperatures within the range of the enclosed thermometer may be used, if consistent with the type of sample and the necessary limiting conditions shown in Table 3.

<sup>A</sup> Indication of the thermometer range is made by the use of the listed designation used as a suffix to the ASTM hydrometer number. For example, 54HL is an instrument with an API gravity range of 29 to 41°API and a thermometer range of 0 to 150°F. An instrument with the same gravity range but a thermometer range of 60 to 220°F would be designated 54HH. The number 57HM would identify an instrument with an API gravity range of 59 to 71°API and a thermometer range of 30 to 180°F.

| TABLE 3 Limiting Conditions and Test Temperatu |
|--|
|--|

|                                     | -                      |                                      |   |
|-------------------------------------|------------------------|--------------------------------------|---|
| Sample Type                         | Initial Boiling Point  | Other Limits                         | Test Temperature  |
| Volatile                            | 120°C (250°F) or lower |                                      | Cool in original closed container to $18^{\circ}C$ (65°F) or lower        |
| Volatile and viscous                | 120°C (250°F) or lower | Viscosity too high<br>at 18°C (65°F) | Heat to minimum temperature to obtain sufficient fluidity                 |
| Non-volatile                        | Above 120°C (250°F)    |                                      | Use any temperature between -18°C and 90°C (0 and 195°F)<br>as convenient |
| Mixture with non-petroleum products |                        |                                      | Test at 15 $\pm$ 0.2°C or 60 $\pm$ 0.5°F                                  |

7.1.2 If the test temperature is significantly different from the reference temperature of  $15^{\circ}$ C or  $60^{\circ}$ F, the expansion or contraction of the glass may affect the calibration of the

thermohydrometer. A hydrometer correction factor (*HYC*) may be applied to the measured density value to provide a corrected
