Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 189, *Ceramic tile*.

ISO/TR 17870 consists of the following parts, under the general title *Ceramic tiles — Guidelines for installation*:

- *Part 1: Installation of ceramic wall and floor tiles*
- *Part 2: Installation of thin ceramic wall and floor tiles and panels*

Introduction

There are currently International Standards available for

- ceramic tiles, and
- adhesives and grouts for tiles.

NOTE ISO 13007-5, dealing with liquid-applied waterproofing membranes for use beneath ceramic tiling bonded with adhesives, is under preparation.

For these products to give satisfactory service, they need to be selected and installed competently, and they have to receive appropriate initial treatment, protection, and maintenance.

Some countries have published standards and/or guides that specify the design and installation of ceramic tiling. The purpose of ISO/TR 17870 is to foster good installation practices for ceramic wall and floor tiles, internationally.

Ceramic tiles — Guidelines for installation —

Part 1: Installation of ceramic wall and floor tiles

1 Scope

This part of ISO/TR 17870 defines the quality of ceramic tiling and provides guidance for materials selection, installation and use, to achieve required levels of quality and performance.

It considers aspects related to the specification and installation of the tiling project, in terms of:

- manufacture and distribution of the materials (ceramic tiles, adhesives, grouts, etc.);
- specification of the tiling;
- installation of the tiling (tile fixing operations).

It is applicable to internal and external floor and wall ceramic tiling, installed by either cement mortar or other adhesive methods.

NOTE The quality of ceramic tiling depends on the following general characteristics:

- regularity;
- durability;
- safety.

ITeH STANDARD PREVIEW
(standards.iteh.ai)
<https://standards.iteh.ai/catalog/standards/sist/6bad4ff8-576a-4600-a282-3dc94fb5c2a4/iso-tr-17870-1-2015>

The durability of the tiling can depend on its use and management.

2 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

2.1 General

2.1.1

ceramic tiling

ceramic tiles installed, together with its associated bedding and jointing

2.1.2

design (of ceramic tiling)

specification (of ceramic tiling)

selection of ceramic tiles, backgrounds, fixing methods, and fixing and jointing materials as appropriate for the structure and intended use

2.1.3

installation (of ceramic tiling)

tile fixing

application of ceramic tiling in accordance with the specification

2.2 Components of ceramic tiling

2.2.1

background

material system used as a base over which the ceramic tile is to be fixed

2.2.2

filling out layer

separate application of material to achieve the required vertical flatness (walls)

EXAMPLE Plaster, render, proprietary tile backer boards.

2.2.3

fixing surface

plane rigid surface upon which the tile is fixed

2.2.4

insulating layer

layer included to obtain sound or thermal insulation

2.2.5

intermediate joint

movement joint to divide large areas of tiling into smaller, approximately square areas

2.2.6

levelling layer

layer applied to compensate for unevenness and differences in height of the base or to accommodate services (floors)

2.2.7

movement joint

joint in tiles, backgrounds, or substrates designed to accommodate movement

Note 1 to entry: Types of movement joints: structural joint, perimeter joint, intermediate joint.

2.2.8

perimeter joint

movement joint to isolate the ceramic tiling from adjacent building elements

2.2.9

primer

fluid material, used separately or mixed with binder to form a slurry, applied as a thin layer to improve adhesion of the bedding to the background, or to isolate the bedding material from the background surface

2.2.10

separating layer

material which separates layers within the tiling system

2.2.11

structural joint

movement joint in ceramic tiling to correspond with structural movement joint in the background

2.2.12

tile bed bedding

layer of specified materials in which the tile is set and which bonds the tiles to the background

2.2.13

tile joint

space between adjacent tiles

2.2.14**waterproofing membrane**

continuous layer of impervious material to resist the passage of water

2.3 Tiling techniques and operations**2.3.1****bonded method**

floor tiling laid with a system which ensures that the bedding is bonded to the background

2.3.2**buttering method**

adhesive or mortar applied to the back of the tiles, just before the tile is placed

2.3.3**contact area**

proportion of the tile back and/or background support that is in contact with the bedding after the tile has been fixed into position

2.3.4**direct bedding**

tile fixing directly onto a structural background

2.3.5**floating method**

adhesive or mortar applied to the fixing surface, just before the tile is placed

2.3.6**floating and buttering method**

adhesive or mortar applied to the fixing surface and to the back of the tile, just before the tile is placed

2.3.7**grouting**

operation of filling the joint space between tiles other than at movement joints

2.3.8**maintenance (of ceramic tiling)**

all aspects of the cleaning, treatment, and periodic repair of damage to the ceramic tiling

2.3.9**plastering**

application of a gypsum plaster to a vertical background

2.3.10**rendering**

application of a cement mortar to a vertical background

2.3.11**screeding**

application of a screed on a floor background

2.3.12**tanking**

application of an impermeable layer beneath tile and bedding to prevent water penetration into the background

2.3.13**unbonded method**

any method of laying floors which provides separation of the tiling system from the background

2.4 Characteristics/aspects of ceramic tiling

2.4.1

durability

quality of tiling which maintains its characteristics over time

2.4.2

flatness

conformity of the surface of the tiling to a theoretical plane within an allowable tolerance

2.4.3

levelness

conformity of the surface of floor tiling to a fixed horizontal level within an allowable tolerance

2.4.4

lippings

deviation between tile surfaces either side of a joint (including movement joints)

2.4.5

plumbness

conformity of the surface of wall tiling, designed to be vertical, to a fixed plane within an allowable tolerance

2.4.6

slip resistance

ability of a floor tile to provide sufficient friction to resist slipping by pedestrians

3 Exchange of information

(standards.iteh.ai)

In order for the correct floor/wall covering to be installed in appropriate conditions, at the right time, etc., it is essential that all parties have a clear understanding of the requirements of the project. To ensure that this is achieved, it is essential that there is wide consultation between all the parties involved in the project, including client, sub-contractors, and materials suppliers.

As each project will be unique, it is impossible to give a definitive list of the information to be exchanged, but the following are common examples.

- a) Specification: the information required (see [Clause 5](#)).
- b) Special attendances: access, unloading, hoisting and storage facilities, heat, light and power, and any additional items considered necessary to expedite the work.
- c) Materials: technical specification and instructions for transport, storage, use.
- d) Backgrounds: type and age of construction; location within the building; type, characteristics (mechanical strength, deformation, etc.), and regularity of background (see [Clause 5](#)); and any need for an intermediate substrate or for movement joints.
- e) Associated work: services embedded in or passing through the backgrounds and junctions with other adjacent finishes
- f) Finishes: type, size, and colour of tiles and layout requirements.
- g) Installation: type and technique (see [Clause 6](#)).
- h) Programme: a time schedule for the progress of the work taking into consideration drying and curing periods of backgrounds and tiling until completion.

4 Materials

4.1 General

This clause identifies and lists the materials that can be involved in a ceramic tiling installation, and defines the main information and rules that apply to these materials.

The identification and selection of materials suitable for any given application are aspects of the specification. The relative criteria are therefore set out in [5.3](#).

4.2 Basic materials

The basic materials for tiling are the following:

- finishing layer:
 - ceramic tiles;
 - cementitious grouts;
 - reaction resin grouts;
 - pre-prepared or proprietary grouts;
- bedding:
 - mortar;
 - cement;
 - other binders;
 - sand and aggregates (gravel, crushed stone, etc.);
 - water;
 - admixtures;
 - adhesives;
- movement joints:
 - sealants;
 - primers;
 - back-up materials;
 - special components (profiles, etc.).

Additional intermediate layers can be the following:

- primers;
- separating layer;
- filling out layer;
- levelling layer;
- anti-fracture/de-coupling membranes;
- waterproofing membrane;
