

Designation: D 4976 – 00b

Standard Specification for Polyethylene Plastics Molding and Extrusion Materials¹

This standard is issued under the fixed designation D 4976; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

INTRODUCTION

This specification is not intended for the selection of materials, but only as a means to call out plastic materials to be used for the manufacture of parts. The selection of these materials is to be made by personnel with expertise in the plastics field where the environment, inherent properties of the materials, performance of the parts, part design, manufacturing process, and economics are considered. This specification does not specify the source of the resin to be used for the fabrication of any given article.

1. Scope *

1.1 This specification provides for the identification of polyethylene plastics molding and extrusion materials in such a manner that the supplier and the user can agree on the acceptability of different commercial lots or shipments. The tests involved in this specification are intended to provide information for identifying materials according to the groups, classes, and grades covered. It is not the function of this specification to provide specific engineering data for design purposes.

1.2 Other requirements may be necessary to identify particular characteristics important to specialized applications. These shall be agreed upon between the user and the supplier, by using the suffixes given in Section 1.3.

1.3 Ethylene plastic materials, being thermoplastic, are reprocessible and recyclable (see Note 1). This specification allows for the use of those ethylene plastic materials, provided that any specific requirements as governed by the producer and the end user are met.

NOTE 1—See Guide D 5033 for information and definitions related to recycled plastics.

1.4 The values stated in SI units are regarded as the standard.

1.5 The following precautionary caveat pertains to the test method portion only, Section 12, of this specification. *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

¹ This specification is under the jurisdiction of ASTM Committee D20 on Plastics and is the direct responsibility of Subcommittee D20.15 on Thermoplastic Materials.

Current edition approved Nov. 10, 2000. Published January 2001. Originally published as D 4976 – 95. Last previous edition D 4976 – 00a.

1.6 For information regarding plastic pipe materials see Specification D 3350. For information regarding wire and cable materials, see Specification D 1248.

NOTE 2—There is no similar or equivalent ISO standard.

3. Terminology

3.1 *Definitions*—For definitions of technical terms pertaining to plastics used in this specification, see Terminology D 883 and Terminology D 1600.

3.2 Historical usage and user group conventions have resulted in inconsistent terminology used to categorize and describe polyethylene resins and compounds. The following terminology is in use in ASTM specifications pertaining to polyethylene:

3.2.1 *Specification D 1248:*

3.2.1.1 Type (0, I, II, III, IV) = density ranges (same, respectively, as Class in Specification D 4976).

3.2.1.2 Class (A, B, C, D) = composition and use.

3.2.1.3 Category (1, 2, 3, 4, 5) = melt index ranges (same as Grade in Specification D 4976).

3.2.1.4 Grade (E, J, D, or W followed by one or two digits) = specific requirements from tables.

3.2.2 *Specification D 3350:*

3.2.2.1 Type (I, II, III) = density ranges (same as Types I, II, and III in Specification D 1248 and Classes 1, 2, and 3 in Specification D 4976).

3.2.2.2 Class = a line callout system consisting of “PE” followed by six cell numbers from Table 1 plus a letter (A, B, C, D, E) denoting color and UV stabilizer.

3.2.2.3 Grade = simplified line callout system using “PE” followed by density and slow crack growth cell numbers from Table 1.

3.2.3 *Specification D 4976:*

3.2.3.1 Group (1, 2) = branched or linear polyethylene.

3.2.3.2 Class (5, 1, 2, 3, 4) = density ranges (same, respectively, as Type in Specification D 1248).

3.2.3.3 Grade (1, 2, 3, 4, 5) = melt index ranges (same as Category in Specification D 1248).

4. Classification

4.1 Unreinforced polyethylene plastic materials are classified into groups according to polymerization processes. These groups are subdivided into classes and grades as shown in Table PE (Basic Property Table).

0	0	0	...	0		

^A Melt index = g/10 min at 190°C/2.16 kg.

^B Type IV tensile bars at 500 mm/min (20 in./min) for materials with densities of 0.925 g/cm³ and less; and 50 mm/min (2 in./min) for materials with densities greater than 0.925 g/cm³.

^C Secant Modulus at 2 % strain using Procedure B with 50.8-mm (2-in.) span on 3.18 × 12.7-mm (0.125 × 0.5-in.) specimens.

Cell Table A Detail Requirements^A for Polyethylene Plastics

Designation Order Number	Property	Cell Limits									
		0	1	2	3	4	5	6	7	8	9
1	Tensile Strength at Yield, Test Method D 638, MPa ^B , min	unspecified	4	8	12	16	21	30	35	...	specify value
2	Elongation at Break, Test Method D 638, %, min	unspecified	25	50	200	400	600	800	1000	...	specify value
3	Flexural Modulus, Test Methods D 790, MPa ^{A,C} , min	unspecified	50	100	200	400	600	800	1000	...	specify value
4	Thermal stress-crack resistance, hours without cracking, min, Test Method D 2951	unspecified	24	48	96	168	specify value
5	Environmental stress-crack resistance, ^D min F ₅₀ h, Test Method D 1693	unspecified	24	48	96	168	336	672	1008	...	specify value

^A It is recognized that detailed test values may not predict nor even correlate with performance of parts molded of these materials.

^B MPa × 145 = psi.

^C Using test specimens with a nominal cross section of 3.2 × 12.7 cross section and a span of 50.8 mm.

^D F₅₀ is the time required for failure of 50 % of the specimens tested in accordance with the graphical method described in Test Method D 1693. Class 1 polyethylenes shall be tested in accordance with Test Method D 1693, Condition A. Classes 2, 3, 4, and 5 shall be tested in accordance with Condition B. Igepal concentration for all conditions is 100 %. Mold samples in accordance with Procedure C of Practice D 1928 (cooling rate of 15 ± 2°C/min).
