Part 5: Cooling performance evaluation for indoor cabinets

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62610-5 has been prepared by subcommittee 48D: Mechanical structures for electrical and electronic equipment, of IEC technical committee 48:Electrical connectors and mechanical structures for electrical and electronic equipment.

The text of this standard is based on the following documents:

CDV	Report on voting
48D/591/CDV	48D/604/RVC

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 62610 series, published under the general title *Mechanical structures for electrical and electronic equipment – Thermal management for cabinets in accordance with IEC 60297 and IEC 60917 series*, can be found on the IEC website.

Future standards in this series will carry the new general title as cited above. Titles of existing standards in this series will be updated at the time of the next edition.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

SIST EN 62610-5:2016

<https://standards.iteh.ai/catalog/standards/sist/f2545ed4-4c71-4214-b42f-1cf06f040802/sist-en-62610-5-2016>

INTRODUCTION

Indoor cabinets containing electronic equipment in subrack(s) and/ or chassis provide cooling by several different means, depending on the heat load of the equipment in the cabinet. In most cases air convection is used for cooling. The cabinets can be sealed or non-sealed, and may be equipped with fans for forced air cooling or rely on natural convection cooling without fans. In addition the subrack(s) or chassis may contain their own fans or rely on natural convection. Air convection systems are used to cool low to medium heat load applications. Indoor cabinets containing subrack(s) and/ or chassis assembled with high heat load electronic equipment typically are cooled by air to air heat exchangers or water supplied heat exchangers, and are not considered in this standard.

Sealed cabinets are used for systems operated in an industrial atmosphere, to protect the equipment against harsh environments, such as dust or water (IP), or provisions for EMC or acoustic noise. Non-sealed cabinets are used in offices, laboratories or data centres, where the environment is controlled.

The cooling performance of an electronic cabinet depends on the type of the cabinet, either sealed or non-sealed, with or without air moving devices, ventilated or re-circulated, and also, on the heat loads and the additional cooling systems (if any) of the equipment inside the cabinet.

Therefore, it is difficult to determine properly the cooling capabilities of empty electronic cabinets for various applications. This standard introduces a simplified method for an overall cooling performance evaluation for empty indoor cabinets in accordance with IEC 60917 or IEC 60297 series.

(standards.iteh.ai)

The purpose of this standard is to classify the cooling methods of empty indoor cabinets, to simplify the thermal hydraulic formulae for the evaluation and classification of cabinet cooling performances, and to exemplify the cooling performances for representative cabinet sizes based on IEC 60917 or IEC 60297.

This enables the users to select the appropriate cabinet cooling solutions for their applications.

**MECHANICAL STRUCTURES FOR ELECTRICAL
AND ELECTRONIC EQUIPMENT –
THERMAL MANAGEMENT FOR CABINETS IN
ACCORDANCE WITH IEC 60297 AND IEC 60917 SERIES –**

Part 5: Cooling performance evaluation for indoor cabinets

1 Scope

This part of IEC 62610 specifies a method for evaluating the cooling capacity mainly for air convection cooling of empty cabinets in accordance with IEC 60297 and IEC 60917 series.

2 Normative references

Void.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

ventilation

movement of the air inside a cabinet, causing replacement of the inside air by the cabinet external ambient air

3.2

buoyancy

force of air in the opposite direction of gravity that is produced by the difference in density due to the temperature differences between the air inside and external to the cabinet

3.3

natural ventilation

air movement produced by buoyancy

3.4

forced air cooling

forced ventilation

ventilation by air moving devices

3.5

natural convection cooling

cooling by natural air convection and radiation

3.6

air moving device

device creating air movement, e.g. fans, blowers, and other forced air movement equipment

3.7

sealed cabinet, without air moving devices

cabinet not provided with ventilation holes, not equipped with air moving devices, where the heat is transferred to the external environment by natural convection and radiation from the external surfaces of the cabinet

Note 1 to entry: The internal air temperature gradually increases from the bottom to the top of the cabinet.

3.8

sealed cabinet, with air moving devices

cabinet not provided with ventilation holes, equipped with air moving devices for re-circulating internal air, where the heat is transferred from the surface of the cabinet towards the outside of the cabinet both by convection (forced inside, natural outside) and by radiation

Note 1 to entry: A sealed cabinet without air moving devices which contains subracks or chassis systems with air moving devices may be equivalent to a sealed cabinet with air moving devices.

Note 2 to entry: The cooling performance of this type of cabinet is equal to that of "the sealed cabinet, without air moving devices" because the heat transfer mechanism to the external environment is identical, however the internal air temperature is equalized.

3.9

non-sealed cabinet, without air moving devices

cabinet where the heat is transferred by natural convection from the provided ventilation holes and, in addition, the heat is transferred to the external environment by natural convection and radiation from the external surfaces of the cabinet

Note 1 to entry: The source of the natural ventilation airflow is only by buoyancy of the cabinet internal air, even if there are some subracks or chassis systems with air moving devices, except if the air moving devices airflow goes directly outside of the cabinet.

3.10

non-sealed cabinet, with air moving devices

cabinet equipped with air moving devices and ventilation holes

Note 1 to entry: Two cooling modes, re-circulation and forced ventilation, are utilized for this type of cabinet, depending on the location of the air moving devices.

3.11

air moving devices on the subrack <re-circulation>

cabinet equipped with subracks and/or chassis with air moving devices

Note 1 to entry: The air inside the cabinet is re-circulated by subrack or chassis mounted fans, but is not ventilated by the fans.

3.12

air moving devices on a cabinet <forced ventilation>

cabinet equipped with air moving devices on the top cover, bottom cover or the rear cover of the cabinet, it does not matter if the fans are mounted internal or external to the cabinet

Note 1 to entry: The air moving devices force the air to exit the cabinet through ventilation holes. If the cabinet mounted air moving devices airflow is larger than the combined airflow of the cabinet mounted subrack and/or chassis systems the temperature rise inside the cabinet may be zero.

Note 2 to entry: If the cabinet mounted air moving devices airflow is smaller than the combined airflow of the cabinet mounted subrack and/or chassis systems, this will cause cabinet internal air re-circulation. The maximum cabinet internal air temperature will be equal to the maximum cabinet mounted subrack and/or chassis system air exit temperature.

3.13

simplified cooling performance evaluation

method to estimate the heat load of a cabinet based upon the chosen cooling mechanism, the cabinet internal temperature limit, typical ambient temperature / humidity, and the overall cabinet size chosen for the application

Note 1 to entry: The criteria definition of conditions for the simplified cooling performance are shown in Clause 5.

Note 2 to entry: It is assumed that the cabinets are used in an standalone application. If cabinets are arranged side-by-side, placed along a building wall or back to back the cooling performance may be reduced due to loss of heat transfer surface area.
