[ISO/DIS 7195](https://standards.iteh.ai/catalog/standards/sist/3bc1e2d3-fb01-44c2-9984-44c41da2dae7/iso-dis-7195)

<https://standards.iteh.ai/catalog/standards/sist/3bc1e2d3-fb01-44c2-9984-44c41da2dae7/iso-dis-7195>

THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 7195 was prepared by Technical Committee ISO/TC 85, *Nuclear energy*, Subcommittee SC 5, *Nuclear fuel technology*.

This third edition cancels and replaces the second edition (ISO 7195:2005) which has been technically revised.

## Introduction

The transport of uranium hexafluoride (UF<sub>6</sub>) is an essential operation in the nuclear industry. The packaging and transport of UF<sub>6</sub> is subject to the relevant transport regulations for dangerous goods of each of the countries through or into which the material is transported. This International Standard does not take precedence over applicable governmental regulations, nor does it relieve the consignor and other parties from compliance with these regulations. For more detailed information, the user of this International Standard is encouraged to consult the appropriate regulatory document.

The United States Standard ANSI N14.1 (first issued in 1971) has been used internationally as an industry reference and the standard cylinders included in ANSI N14.1 have been used widely for international transport of UF<sub>6</sub>. However, in some cases minor adaptations of the American standard were required to meet local conditions in a particular country. For example, equivalent materials may have been used instead of the materials specified. Moreover, the certification of cylinders as pressure vessels can have required equivalent authorization procedures appropriate in the countries concerned, rather than the US certification procedure specified.

This International Standard presents primarily information on UF<sub>6</sub> packagings (including valves, plugs, and valve protectors). It is intended to provide for compatibility of UF<sub>6</sub> packagings among different users within the nuclear industry. It has been developed from ANSI N14.1, but with incorporation of, and allowance for, other equivalent materials and national authorization and certification procedures. ISO 7195 was first issued in 1993 and a revision was published in 2005.

Throughout this International Standard and in conformity with standard ISO practice, SI metric units are used in preference to imperial units (which are given in parenthesis for information). However, generic packaging designations are based on the cylinder diameter expressed in imperial units (48" for instance)

If a common, commercially available component uses features that are defined in an appropriate non-SI metric-based Standard document, only the relevant base units are quoted.

# Nuclear energy – Packagings for the transport of uranium hexafluoride (UF<sub>6</sub>)

## 1 Scope and purpose

This International Standard provides requirements for the procurement and fabrication of new packagings (including valves, plugs, and valve protectors) for transport of 0.1 kg or more of uranium hexafluoride (UF<sub>6</sub>) and for inspection, cleanliness, and maintenance of packagings in service.

It is intended to provide for compatibility of UF<sub>6</sub> packagings among different users within the nuclear industry.

## 2 Normative references

The following referenced documents are indispensable for the application of this document.

For dated references, the edition current at the time of publication of this International Standard applies. Editions that supersede these may be adopted with approval of the competent authority.

For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 9453, Soft solder alloys — Chemical compositions and forms

ISO 9712, Non-destructive testing — Qualification and certification of personnel

ISO 12807, Safe transport of radioactive material – Leakage testing on packages

Note For the purpose of this International Standard, ANSI N14.5-1997, Leakage tests on packages for shipment, may be used in lieu of ISO 12807

IAEA Transport Regulations (Regulations for the Safe Transport of Radioactive Materials - Edition applicable at the time of publication of this standard)

EN 10025:1990, Hot rolled products of non-alloy structural steels — Technical delivery conditions

EN 10025:1990/A1:1993, Amendment 1

EN 10028-3:2003 Flat products made of steels for pressure purposes — Part 3: Weldable fine grain steels, normalized

EN 10088-2:1995, Stainless steels — Part 2: Technical delivery conditions for sheet/plate and strip for general purposes

Note 1 Codes and standards with corresponding versions using metric units may be used interchangeably.

Note 2 With respect to this International Standard, American Society of Mechanical Engineers (ASME) material and filler metal specifications, identified by the prefix “S,” are interchangeable with corresponding ASTM International (ASTM) and American Welding Society (AWS) specifications referenced herein.

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in the IAEA Transport Regulations and the following apply.

Note 1 Throughout this International Standard, the word *shall* denotes a requirement; the word *should* denotes a recommendation; the word *may* denotes a permission, neither a requirement nor a recommendation.

Note 2 Units are those of the International System, with other units shown in brackets for information.

Note 3 Throughout this International Standard, the words *suggested* and *typical* denote an example for weld constructions, dimensions and/or layout, and means that other solutions may be used provided they comply with the requirements in the Code and this International Standard, as appropriate.

Note 4 Throughout this International Standard, the words *nominal* and *Schedule* qualify a thickness of a material from stock (plate, bar, pipe, etc.), for which the tolerance is according to the standard specification for the relevant material.

### 3.1

#### **authorized inspector**

individual who is qualified by the jurisdictional / inspection authority

### 3.2

#### **clean and washed out cylinder**

cylinder that has been previously used and has been cleaned to remove residual quantities of uranium and other contaminants ; any material left behind on the inside surface of the cylinder after the cleaning operation shall:

- a. not obstruct the internal examination as required in 5.4.2.2-1 of this standard,
- b. not influence the quality and chemical purity of the next UF<sub>6</sub> fill, and
- c. not react with UF<sub>6</sub>

(standards.iteh.ai)

This definition should not be confused with the category of empty packaging classified under UN 2908 in IAEA Transport Regulations

[ISO/DIS 7195](https://standards.iteh.ai/catalog/standards/sist/3bc1e2d3-fb01-44c2-9984-44c41da2dae7/iso-dis-7195)

<https://standards.iteh.ai/catalog/standards/sist/3bc1e2d3-fb01-44c2-9984-44c41da2dae7/iso-dis-7195>

### 3.3

#### **code** or “the Code”

pressure vessel code that is acceptable to the competent authority; Section VIII of ANSI/ASME Boiler and Pressure Vessel Code is an example

### 3.4

#### **competent authority**

national or international regulatory body or authority designated or otherwise recognized as such for any purpose in connection with this International Standard

### 3.5

#### **competent inspector**

individual who is qualified according to the owner's requirements regarding inspection activities as detailed in its quality assurance program

### 3.6

#### **cylinders**

common term used to refer to the packagings defined by this standard

### 3.7

#### **fabricator**

manufacturer, repairer, or modifier of cylinders

### 3.8

#### **heel**

residual amount of UF<sub>6</sub> and/or nonvolatile reaction products in excess of the tare

**3.9**

**heeled cylinder**

a cylinder containing a heel in quantities equal to or less than those specified in Table 8 in this document.

This definition should not be confused with the category of empty packaging classified under UN 2908 in IAEA Transport Regulations

**3.10**

**jurisdictional / inspection authority**

entity with the power, right, or authority to interpret and enforce laws, rules, or ordinances pertaining to the Code

**3.11**

**licensee-user**

person or organization that is authorized to conduct activities under a license issued by a competent authority

**3.12**

**minimum design metal temperature (MDMT)**

minimum value of design metal temperature at the maximum value of cylinder design pressure to meet the Code requirements

**3.13**

**maximum allowable working pressure (MAWP)**

maximum value of cylinder design internal gauge pressure at the maximum value of cylinder design temperature

**3.14**

**maximum allowable external working pressure (MAEWP)**

maximum value of cylinder design external gauge pressure difference at the maximum value of cylinder design temperature

**3.15**

**new cylinder**

cylinder that has been cleaned to remove fabrication debris and contaminants that would react with UF<sub>6</sub> and that has never been filled with UF<sub>6</sub>

**3.16**

**owner**

individual, agency, contractor, company, or corporation that carries or will carry title to the packaging during its use

**3.17**

**outer protection**

mechanical and / or thermal protection for cylinders containing UF<sub>6</sub>, during transport

**3.18**

**service life**

period of time from initial cylinder acceptance of any radioactive material until the cylinder is no longer suitable for transport of UF<sub>6</sub>, in accordance with this International Standard.

**3.19**

**tare**

cylinder mass with valve(s), including cap(s), and plug(s) without valve protector with an internal air or nitrogen total pressure corrected to 34,5 kPa (5 lbf/in<sup>2</sup>)

Note 1 The tare, colloquially designated tare weight, is denominated in kilograms (pounds).

Note 2 The tare is established before the new cylinder is placed in service and after each five-year periodic inspection

## 4 Management system

The licensee-user shall have a management system that meets the applicable requirements of the competent authorities, for the manufacture, maintenance, repair, and use of the packaging. Certain quality related activities may be satisfied by obtaining certificates from packaging suppliers (fabricators) stating that their activities were conducted in accordance with a quality management system that meets the requirements of the competent authorities.

Fabricators shall be notified concerning their contribution to the above quality management system.

## 5 General requirements for cylinders

UF<sub>6</sub> shall be packaged for transport in cylinders meeting the manufacture, inspection, testing, and certification and service requirements of this International Standard.

When shipped, all UF<sub>6</sub> packages shall incorporate a feature, such as a seal that, while intact, shall provide assurance that the cylinder has not been illicitly opened. This also applies when shipping new and clean and washed out cylinders.

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

### 5.1 Design of cylinders

Cylinders shall:

- be as shown in the Figures 3 through 11, and be in accordance with the requirements specified in 6.1 through 6.9 of this International Standard,
- and
- comply with the Code.

In order to minimize points of leakage, only one valve and one plug (where applicable) should be installed. However, if the purchaser deems additional valves or plugs necessary, they shall be installed in accordance with the requirements specified in 6.3 through 6.9.

Lifting lugs shall be:

- as shown in Figure 10, and in accordance with the requirements specified in 6.8 of this International Standard; additional holes or slots may be provided in lifting lugs (e.g., for tie-down) and shall be dimensioned such that the fitness for purpose of the lifting lug is not impaired,
- or
- designed, using an appropriate safety factor, to allow the gross mass of the cylinder to be lifted and restrained during transport.

Additional holes in skirts are permitted and shall be designed such that the fitness for purpose of the package is not impaired.

Details of cylinder (including skirts, stiffening rings, lifting lugs), valve, plug, and valve protector, as applicable, are given in Figures 1 through 16.

Threads identified in this International Standard shall conform to ISO 263, unless otherwise specified in this International Standard.

Metric units shown in this International Standard may have been converted from Imperial units. Rounding of values is acceptable when not in conflict with the functional specification.

### 5.1.1 Design conditions

The parameters given in Table 1, along with the values for the minimum volume shown in Table 4, shall be the basis by which the pressure vessel parts of the various cylinders are designed.

**Table 1 - UF<sub>6</sub> cylinder design conditions**

Cylinder model	Clause	Design pressure / temperature		
		MAEWP	MAWP	MDMT
1S	6.1	172 kPa gauge (25 lbf/in <sup>2</sup> gauge)	1,38 MPa gauge at 121 °C  (200 lbf/in <sup>2</sup> gauge at 250 °F)	-196 °C at 1,38 MPa gauge  (-320 °F at 200 lbf/in <sup>2</sup> gauge)
2S	6.2			
5B	6.3			
8A	6.4			
12B	6.5			
30B	6.6	172 kPa gauge (25 lbf/in <sup>2</sup> gauge)	1,38 MPa gauge at 121 °C  (200 lbf/in <sup>2</sup> gauge at 250 °F)	-29 °C at 1,38 MPa gauge  (-20 °F at 200 lbf/in <sup>2</sup> gauge)
30C	6.7			
48X and 48Y	6.8			

Note The requirements regarding the behaviour at low temperature which are included in the transport regulations shall also be taken into account.

## 5.2 Fabrication of cylinders

### 5.2.1 General

Cylinders shall be fabricated and stamped in accordance with the Code.

Longitudinal seam, head-to-shell girth seams, skirts, stiffening rings, lifting lugs, etc., shall be welded as shown in the relevant figures. Fillet welds shall be in accordance with 5.24 of ANSI/AWS D1.1 and the Code. All butt welds shall be full penetration unless otherwise specified. Longitudinal skirt welds shall be away from lifting holes, holes for valve protector alternate and weep holes. Circumferential cylinder seams should be welded without backing rings. Optionally, circumferential cylinder seams may be welded with backing rings, as shown in Figure 1.

All welders and welding procedures (brazing included) shall be qualified in accordance with the Code.

Where couplings are to be installed in cylinders, an appropriately sized National Pipe Thread (NPT) plug shall be inserted into the coupling for the purposes of the coupling being welded into the cylinder. After welding is completed, the coupling should be allowed to cool before removal of the plug. The coupling threads shall be inspected following removal of the plug. Tapped threads shall be free of all burrs, gouges, scratches, and the like. An appropriate sized NPT tap shall be used for a light chase only. Prior to installing a valve or plug, the coupling shall be gauged to assure compliance with ANSI/ASME B.1.20.1.

Where the material of construction is steel per 5.7, Table 4, at least one test weld representing each welding procedure to be used in the fabrication of the cylinder shall be Charpy V-notch impact tested. Test plates, including those for the appendages, shall have butt-type weld joints. The weld metal specimens shall be taken across the weld with the notch in the weld metal. Each specimen shall be oriented so that the notch is normal to the surface of the material, and one face of the specimen shall be within 1,6 mm (1/16 in) of the surface of the material. Each weld procedure shall be qualified with impact testing. This testing shall be as specified by the Code utilized for the material being welded. Acceptance criteria shall be in accordance with the grade of steel to be used in fabrication of the cylinder. Procedures and qualifications shall be documented as required by the Code. The fabricator shall receive the purchaser's formal acceptance of the test results prior to cylinder fabrication.

## 5.2.2 Radiography and other non-destructive examinations (NDEs)

All NDE personnel shall be certified in accordance with ISO 9712 or equivalent and inspections shall be carried out using Code-compliant procedures. The weld imperfections indicated by NDEs shall not exceed the defects permitted by the Code.

Radiography is applicable for 5B, 8A, 12B, 30B, 30C, 48X and 48Y cylinders, in accordance with the appropriate section of the Code.

For 5B, 8A, 12B, 30B, 48X and 48Y cylinders, the minimum number of spot X-ray examinations for each cylinder shall be as required by the Code. Unless otherwise directed by an authorized inspector, the locations of spots shall be as follows:

1. 5B cylinders: at the circumferential head-to-shell weldment, alternating ends for successive cylinders.
2. 8A, 12B, 30B, 48X, and 48Y cylinders: at the junctions of the longitudinal seam and the circumferential head weld, alternating ends for successive cylinders.

Alternatively (for the purpose of 5.4.2.2), for 30B, 48X and 48Y cylinders without backing bars, the following may be required:

- complete (100%) radiography of the longitudinal seam and the head-to-shell girth seams for each cylinder, and
- additional magnetic particle (MP) or liquid penetrant (PT) testing of shell longitudinal seam, head-to-shell girth seams, skirt-to-head girth seams, valve and plug coupling welds.

The stiffening ring butt welds shall be examined to ensure full weld penetration. Any weld defects shall be repaired.

The welds of the lifting lugs shall be subjected to appropriate NDEs.

For 30C cylinders, the following shall be required:

- complete (100%) radiography of the longitudinal seam and the head-to-shell girth seams for each cylinder shall be required, and
- additional MP and PT testing of other welds (as listed above for the 30B, 48X and 48Y cylinders) and valve protector cover (VPC) assembly welds.
