

## Standard Specification for Cool-Application Filling Compounds for Telecommunications Wire and Cable<sup>1</sup>

This standard is issued under the fixed designation D 4732; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

<sup>ε1</sup> NOTE—The units statement in subsection 1.3 was corrected editorially in July 2008.

### 1. Scope

1.1 This specification covers a variety of compounds used for filling the air spaces in telecommunications wires and cables (both electrical and fiber optic) for the purpose of preventing water and other undesirable fluids from entering or migrating through the cable structure. (For related standards see Specifications D 4730 and D 4731.)

1.2 A cool-application compound is a material that has sufficiently low viscosity that it does not require heating.

~~1.3 The values stated in SI units are the standard.~~

1.3 The values stated in SI units are to be regarded as standard. The values given in parentheses are mathematical conversions to inch-pound units that are provided for information only and are not considered standard.

### 3. Terminology

#### 3.1 ~~Descriptions~~ *Definitions of Terms Specific to This Standard:*

- 3.1.1 *filling material*—any of several materials used to fill the air spaces in the cores of multi-conductor insulated wires and cables, or between buffer tubes covering optical fibers, or within such buffer tubes, or any combination of these configurations and any other cable components, for the purpose of excluding water and other undesirable fluids; especially with regard to telecommunications wire and cable, including optical cable, intended for outside aerial, buried, or underground installations.
- 3.1.2 *producer*—the primary manufacturer of the material.
- 3.1.3 *suppliers*—jobbers and distributors as distinct from producers.

### 4. Classification

#### 4.1 Two basic types of filling compounds are covered, as follows:

- 4.1.1 *Type I*—General-purpose filling compounds include all materials to be used for filling cables ~~which~~ that are not required to function under electrical stress (for example, all-dielectric fiber-optic cable), including filling compounds for fiber-optic loose buffer tubes.
- 4.1.2 *Type II*—Electrical-type filling compounds include materials having prescribed electrical properties and used for filling wires and cables that are required to function fully or partially under electrical stress (including hybrid fiber-optic cable).

### 5. Ordering Information

#### 5.1 Orders for material under this specification shall include the following information:

- 5.1.1 Quantity (mass or volume) for each item,
- 5.1.2 Generic name of the material, such as cool-application cable filling material,
- 5.1.3 Type of Material: Type I, General Purpose, or Type II, Electrical,
- 5.1.4 How Furnished: Drums or Barrels, tank cars or tank trucks, and the like,
- 5.1.5 Certification, if required (Section 13.14),
- 5.1.6 This specification designation, and
- 5.1.7 Any special requirements, as listed in 7.2 and 9.2 and in Sections 10 and 10.2, and in Sections 11 and 12, that apply.

### 6. Materials and Manufacture

6.1 The material and the manufacturing methods used shall be such that the resulting products will conform to the properties and characteristics prescribed in this specification.

### 7. Chemical Composition

7.1 The chemical composition of these materials is not specified. The material may be of any chemical composition suitable for the intended purpose and that meets the requirements of this specification as hereinafter stated.

7.2 When agreed upon between the producer and the purchaser, antioxidant stabilizing additives may be included in the compound formulation to assure specified results in thermal oxidative stability testing.

7.3 Once established, the producer shall not change the composition of the compound in successive lots of material without prior approval of the purchaser.

### 8. Electrical Properties

8.1 When a Type II (electrical) filling compound is specified, the compound shall exhibit the electrical properties in 8.1.1 and 8.1.2. The electrodes used shall be parallel plates of solid or foil metal of a size and shape appropriate for the specimen holder; ~~other~~ holder. Other electrodes may be used as agreed upon between the producer and the purchaser. The voltage applied and the time of the electrification shall be appropriate for the instrumentation used and as agreed upon between producer and purchaser.

8.1.1 When tested, in accordance with Test Method D 150 or D 4872, at a temperature of  $23 \pm 3$  °C, the dissipation factor shall not exceed 0.0010 at a frequency of 1 MHz and the permittivity shall not exceed 2.30.

8.1.2 When tested, in accordance with Test Method D 257, at a temperature of  $23 \pm 3$  °C, the volume resistivity shall be not less than  $10^{13}$  Ω·cm.

### 9. General Requirements

9.1 ~~All filling compounds manufactured in accordance with this specification shall meet the following requirements:~~

#### 9.1.1 Physical Properties
