## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 160, *Glass in building*, Subcommittee SC 1, *Product considerations*.

ISO 11485 consists of the following parts, under the general title *Glass in building* — *Curved glass*:  
[ISO 11485-3:2014](http://www.iso.org/iso/11485-3-2014)

- *Part 1: Terminology and definitions*
- *Part 2: Quality requirements*
- *Part 3: Requirements for curved tempered and curved laminated safety glass*

## Introduction

Curved tempered safety glass has a breakage behaviour that is different to annealed glass. This behaviour is a direct result of the high surface prestress and the stress profile within the glass.

Curved tempered safety glass has a known behaviour under accident human impact.

Curved laminated safety glass has safety properties that are different to annealed glass. This behaviour is a direct result of the assembly of two or more glass panes with one or more interlayers.

Curved laminated safety glass has a known behaviour under accidental human impact.

# Glass in building — Curved glass —

## Part 3:

# Requirements for curved tempered and curved laminated safety glass

## 1 Scope

This part of ISO 11485 defines the conditions to classify a curved glass product as a curved safety glass.

This part of ISO 11485 classifies curved tempered glass and curved laminated glass as safety glasses used in buildings, by performance under impact and by mode of breakage. The classification by drop height corresponds to graded values of energy transmitted by the impact of a person.

The classification system in this part of ISO 11485 relates to increasing personal safety by

- the reduction of cutting and piercing injuries to persons, and
- the containment characteristics of the material.

This part of ISO 11485 covers fracture characteristics, including fragmentation test and the physical and mechanical characteristics of curved tempered safety glass for use in buildings.

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 11485-1 and the following apply.

#### 3.1 equivalent flat glass

flat glass of the same nature, thickness, and composition, produced on the same equipment and under the same process conditions as the production of curved safety glass, but with a radius equal or near to the infinite for the purpose of pendulum impact testing

#### 3.2 curved tempered safety glass

curved tempered glass that is distinguished by a fragmentation test as per [Clause 5](#) and by an impact test as per [Clause 8](#), and their requirements

#### 3.3 curved heat-soaked tempered safety glass

curved heat-soaked tempered glass that is distinguished by a fragmentation test as per [Clause 5](#) and by an impact test as per [Clause 8](#), and their requirements

#### 3.4 curved laminated safety glass

curved laminated glass that is distinguished by an impact test as per [Clause 8](#), and its requirements

### 4 Glass products

iTeh STANDARD PREVIEW  
(standards.iteh.ai)

#### 4.1 Curved tempered safety glass

Curved tempered safety glass is made from a monolithic flat glass generally corresponding to one of the following International Standards:

- soda lime silicate glass according to ISO 16293-1;
- float glass according to ISO 16293-2;
- drawn sheet glass according to EN 572-4;
- patterned glass according to ISO 16293-5;
- coated glass according to ISO 11479-1.

Other nominal thicknesses of glass than those covered in the above standards are possible.

#### 4.2 Curved laminated safety glass

Curved laminated safety glass is made of at least 2 monolithic curved glasses corresponding to the following International Standard:

- Curved glass according to ISO 11485-1

NOTE The curved glasses used to make the laminated glass can be annealed, tempered, heat-strengthened, or chemically strengthened.

## 5 Fragmentation test for curved tempered safety glass

### 5.1 General

In the event of breakage, curved tempered safety glass fractures into numerous small pieces, the edges of which are generally blunt.

The fragmentation test determines whether the glass breaks in the manner prescribed for a curved tempered safety glass. This fragmentation test shows the behaviour of breakage of a curved tempered safety glass without any stress of external action, only by the pre-stress.

The fragmentation in service might not always correspond to that determined during the fragmentation test due to the imposition of other stresses, i.e. from fixing or from reprocessing (e.g. laminating).

This fragmentation behaviour ignores any influence of support conditions and is a representation of the effect of the surface pre-stress.

These properties are not size dependent.

### 5.2 Dimensions and number of test specimens

The dimensions of the test specimens shall have a length of 360 mm and a chord of 1 100 mm, without holes, notches, or cut-outs.

NOTE With some equipment, the dimension of 360 mm can be difficult to temper. In that case, a sample with a length of 500 mm and a chord of 1 100 mm can be used.

Two radiuses will be tested: (standards.iteh.ai)

- The minimum possible radius that can be given to a glass of that dimensions, with the equipment used; <https://standards.iteh.ai/catalog/standards/sist/fec81a33-2e46-4e18-8a72-a21a701f9958/iso-11485-3-2014>
- A radius of  $(5\ 000 \pm 500)$  mm. [a21a701f9958/iso-11485-3-2014](https://standards.iteh.ai/catalog/standards/sist/fec81a33-2e46-4e18-8a72-a21a701f9958/iso-11485-3-2014)

NOTE The girth should be calculated for the specific radius, in order to have a chord equal to 1100 mm,

Samples should be representative of production. Test specimen shall be manufactured under the conditions that are applicable for the production of that type/thickness of product.

Five specimens shall be tested for each radius.

### 5.3 Test procedure

An adhesive film can be applied on the convex side of the test specimen, on the whole surface.

The test specimen will be placed on a flexible plate, e.g. plywood, with the concave side up. This flexible plate will be fixed in its centre on a support piece, to avoid movement of the whole during impact.

Support blocks (polystyrene, wood) will be placed on the straight edges to accommodate the curvature of the glass (see [Figure 1](#)).

Each test specimen shall be impacted, using a pointed steel tool, at a position 20 mm in from the longest edge of the test specimen at the mid-point of that edge, until breakage occurs (see [Figure 2](#)).

For curved tempered glass manufactured by vertical tempering, the impact point shall not be on the tong mark edge.

NOTE The fragmentation characteristics of glass are unaffected by temperatures between  $-50\text{ °C}$  and  $+100\text{ °C}$ .

Examples of steel tools are a hammer of about 75 g mass, a spring loaded centre punch, or other similar appliance with a hardened point. The radius of curvature of the point should be approximately 0,2 mm.
