### Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 17090-1 was prepared by Technical Committee ISO/TC 215, Health informatics.

This second edition cancels and replaces the first edition (ISO 17090-1:2008), of which it constitutes a minor revision.

ISO 17090 consists of the following parts, under the general title *Health informatics — Public key infrastructure*: (standards.iteh.ai)

— Part 1: Overview of digital certificate services

ISO 17090-1:2013

- Part 2: Certificate profile
- Part 3: Policy management of certification authority -17090-1-2013

Annex A of this part of ISO 17090 is for information only.

### Introduction

The healthcare industry is faced with the challenge of reducing costs by moving from paper-based processes to automated electronic processes. New models of healthcare delivery are emphasizing the need for patient information to be shared among a growing number of specialist healthcare providers and across traditional organisational boundaries.

Healthcare information concerning individual citizens is commonly interchanged by means of electronic mail, remote database access, electronic data interchange, and other applications. The Internet provides a highly cost-effective and accessible means of interchanging information, but it is also an insecure vehicle that demands additional measures be taken to maintain the privacy and confidentiality of information. Threats to the security of health information through unauthorised access (either inadvertent or deliberate) are increasing. It is essential to have available to the healthcare system reliable information security services that minimise the risk of unauthorised access.

How does the healthcare industry provide appropriate protection for the data conveyed across the Internet in a practical, cost-effective way? Public key infrastructure (PKI) and digital certificate technology seek to address this challenge.

The proper deployment of digital certificates requires a blend of technology, policy, and administrative processes that enable the exchange of sensitive data in an unsecured environment by the use of "public key cryptography" to protect information in transit and "certificates" to confirm the identity of a person or entity. In healthcare environments, this technology uses authentication, encipherment, and digital signatures to facilitate confidential access to, and movement of, individual health records to meet both clinical and administrative needs. The services offered by the deployment of digital certificates (including encipherment, information integrity, and digital signatures) are able to address many of these security issues. This is especially the case if digital certificates are used in conjunction with an accredited information security standard. Many individual organisations around the world have started to use digital certificates for this purpose 17090-1:2013

Interoperability of digital certificate technology and supporting policies, procedures, and practices is of fundamental importance if information is to be exchanged between organisations and between jurisdictions in support of healthcare applications (for example between a hospital and a community physician working with the same patient).

Achieving interoperability between different digital certificate implementations requires the establishment of a framework of trust, under which parties responsible for protecting an individual's information rights may rely on the policies and practices and, by extension, the validity of digital certificates issued by other established authorities.

Many countries are deploying digital certificates to support secure communications within their national boundaries. Inconsistencies will arise in policies and procedures between the certification authorities (CAs) and the registration authorities (RAs) of different countries if standards development activity is restricted to within national boundaries.

Digital certificate technology is still evolving in certain aspects that are not specific to healthcare. Important standardisation efforts and, in some cases, supporting legislation are ongoing. On the other hand, healthcare providers in many countries are already using or planning to use digital certificates. This International Standard seeks to address the need for guidance of these rapid international developments.

This International Standard describes the common technical, operational, and policy requirements that need to be addressed to enable digital certificates to be used in protecting the exchange of healthcare information within a single domain, between domains, and across jurisdictional boundaries. Its purpose is to create a platform for global interoperability. It specifically supports digital certificate-enabled communication across borders, but could also provide guidance for the national or regional deployment of digital certificates in healthcare. The Internet is increasingly used as the vehicle of choice to support the movement of healthcare data between healthcare organisations and is the only realistic choice for cross-border communication in this sector.

This International Standard should be approached as a whole, with the three parts all making a contribution to defining how digital certificates can be used to provide security services in the health industry, including authentication, confidentiality, data integrity, and the technical capacity to support the quality of digital signature.

ISO 17090-1 defines the basic concepts underlying the use of digital certificates in healthcare and provides a scheme of interoperability requirements to establish digital certificate-enabled secure communication of health information.

ISO 17090-2 provides healthcare specific profiles of digital certificates based on the International Standard X.509 and the profile of this specified in IETF/RFC 3280 for different types of certificates.

ISO 17090-3 deals with management issues involved in implementing and using digital certificates in healthcare. It defines a structure and minimum requirements for certificate policies (CPs) and a structure for associated certification practice statements. ISO 17090-3 is based on the recommendations of the informational IETF/RFC 3647, *Internet X.509 Public Key Infrastructure Certificate Policy and Certification Practices Framework*, and identifies the principles needed in a healthcare security policy for cross border communication. It also defines the minimum levels of security required, concentrating on the aspects unique to healthcare.

Comments on the content of this International Standard, as well as comments, suggestions, and information on the application of these standards may be forwarded to the ISO/TC 215 secretariat.

## iTeh STANDARD PREVIEW (standards.iteh.ai)

<u>ISO 17090-1:2013</u> https://standards.iteh.ai/catalog/standards/sist/b96e57b6-68c1-47a9-830c-3db7683a7667/iso-17090-1-2013

## Health informatics — Public key infrastructure —

## Part 1: Overview of digital certificate services

#### 1 Scope

This part of ISO 17090 defines the basic concepts underlying the use of digital certificates in healthcare and provides a scheme of interoperability requirements to establish a digital certificate-enabled secure communication of health information. It also identifies the major stakeholders who are communicating health-related information, as well as the main security services required for health communication where digital certificates may be required.

This part of ISO 17090 gives a brief introduction to public key cryptography and the basic components needed to deploy digital certificates in healthcare. It further introduces different types of digital certificates — identity certificates and associated attribute certificates for relying parties, self-signed certification authority (CA) certificates, and CA hierarchies and bridging structures.

### 2 Normative references TANDARD PREVIEW

The following documents, in whole or in part are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 17090-2:2008, Health informatics cata Public Rely infrastructure c1-4Part 2. Certificate profile 3db7683a7667/iso-17090-1-2013

ISO 17090-3:2008, Health informatics — Public key infrastructure — Part 3: Policy management of certification authority

#### 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

#### 3.1 Healthcare context terms

#### 3.1.1

#### application

identifiable computer running software process that is the holder of a private encipherment key

Note 1 to entry: Application, in this context, can be any software process used in healthcare information systems, including those without any direct role in treatment or diagnosis.

Note 2 to entry: In some jurisdictions, including software, processes can be regulated medical devices.

#### 3.1.2

#### device

identifiable computer-controlled apparatus or instrument that is the holder of a private encipherment key

Note 1 to entry: This includes the class of regulated medical devices that meet the above definition.

Note 2 to entry: Device, in this context, is any device used in healthcare information systems, including those without any direct role in treatment or diagnosis.

#### 3.1.3

#### healthcare actor

regulated health professional, non-regulated health professional, sponsored healthcare provider, supporting organisation employee, patient/consumer, healthcare organisation, device, or application that acts in a health-related communication and requires a certificate for a digital certificate-enabled security service

#### 3.1.4

#### healthcare organisation

officially registered organisation that has a main activity related to healthcare services or health promotion

EXAMPLE Hospitals, Internet healthcare website providers, and healthcare research institutions.

Note 1 to entry: The organisation is recognised to be legally liable for its activities but need not be registered for its specific role in health.

Note 2 to entry: An internal part of an organisation is called here an organisational unit, as in X.501.

#### 3.1.5

#### non-regulated health professional

person employed by a healthcare organisation who is not a regulated health professional

EXAMPLE Medical receptionist who organises appointments or nurses aid who assists with patient care.

Note 1 to entry: The fact that the employee is not authorised by a body independent of the employer in his/her professional capacity does, of course, not imply that the employee is not professional in conducting his/her services.

#### 3.1.6 organisation employee

## (standards.iteh.ai)

person employed by a healthcare organisation or a supporting organisation

EXAMPLE Medical records transcriptionists, healthcare insurance claims adjudicators, and pharmaceutical order entry clerks. https://standards.iteh.ai/catalog/standards/sist/b96e57b6-68c1-47a9-830c-3db7683a7667/iso-17090-1-2013

#### 3.1.7

#### patient

#### consumer

person who is the receiver of health-related services and who is an actor in a health information system

#### 3.1.8

#### privacy

freedom from intrusion into the private life or affairs of an individual when that intrusion results from undue or illegal gathering and use of data about that individual

[SOURCE: ISO/IEC 2382-8:1998]

#### 3.1.9

#### regulated health professional

person who is authorised by a nationally recognised body to be qualified to perform certain health services

EXAMPLE Physicians, registered nurses, and pharmacists.

Note 1 to entry: The types of registering or accrediting bodies differ in different countries and for different professions. Nationally recognised bodies include local or regional governmental agencies, independent professional associations, and other formally and nationally recognised organisations. They may be exclusive or non-exclusive in their territory.

Note 2 to entry: A nationally recognised body in this definition does not imply one nationally controlled system of professional registration but, in order to facilitate international communication, it would be preferable for one nationwide directory of recognised health professional registration bodies to exist.

#### 3.1.10

#### sponsored healthcare provider

health services provider who is not a regulated professional in the jurisdiction of his/her practice, but who is active in his/her healthcare community and sponsored by a regulated healthcare organisation

EXAMPLE A drug and alcohol education officer who is working with a particular ethnic group, or a healthcare aid worker in a developing country.

#### 3.1.11

#### supporting organisation

officially registered organisation which is providing services to a healthcare organisation, but which is not providing healthcare services

EXAMPLE Healthcare financing bodies such as insurance institutions, suppliers of pharmaceuticals and other goods.

#### 3.2 Security services terms

#### 3.2.1

#### access control

means of ensuring that the resources of a data processing system can be accessed only by authorised entities in authorised ways

[SOURCE: ISO/IEC 2382-8:1998]

## 3.2.2 **iTeh STANDARD PREVIEW**

property that ensures that the actions of an entity may be traced uniquely to the entity

[SOURCE: ISO 7498-2:1989]

<u>ISO 17090-1:2013</u>

3.2.3 https://standards.iteh.ai/catalog/standards/sist/b96e57b6-68c1-47a9-830c-

#### asymmetric cryptographic algorithm 3a7667/iso-17090-1-2013

algorithm for performing encipherment or the corresponding decipherment in which the keys used for encipherment and decipherment differ

[SOURCE: ISO/IEC 10181-1:1996]

#### 3.2.4

#### authentication

process of reliably identifying security subjects by securely associating an identifier and its authenticator

[SOURCE: ISO 7498-2:1989]

Note 1 to entry: See also data origin authentication and peer entity authentication.

#### 3.2.5 authorisation

granting of rights, which includes the granting of access based on access rights

[SOURCE: ISO 7498-2:1989]

#### 3.2.6

availability

property of being accessible and useable upon demand by an authorised entity

[SOURCE: ISO 7498-2:1989]

#### 3.2.7

#### ciphertext

data produced through the use of encipherment, the semantic content of which is not available

Note 1 to entry: Adapted from ISO 7498-2:1989.

#### 3.2.8

#### confidentiality

property that information is not made available or disclosed to unauthorised individuals, entities, or processes

[SOURCE: ISO 7498-2:1989]

#### 3.2.9

#### cryptography

discipline which embodies principles, means, and methods for the transformation of data in order to hide its information content, prevent its undetected modification, and/or prevent its unauthorised use

[SOURCE: ISO 7498-2:1989]

#### 3.2.10

#### cryptographic algorithm

#### cipher

method for the transformation of data in order to hide its information content, prevent its undetected modification, and/or prevent its unauthorised use

[SOURCE: ISO 7498-2:1989] iTeh STANDARD PREVIEW

#### 3.2.11

## (standards.iteh.ai)

**data integrity** property that data have not been altered or destroyed in an unauthorised manner

[SOURCE: ISO 7498-2:1989] https://standards.iteh.ai/catalog/standards/sist/b96e57b6-68c1-47a9-830c-3db7683a7667/iso-17090-1-2013

#### 3.2.12

data origin authentication corroboration that the source of data received is as claimed

[SOURCE: ISO 7498-2:1989]

#### **3.2.13 decipherment decryption** process of obtaining, from a ciphertext, the original corresponding data

#### [SOURCE: ISO/IEC 2382-8:1998]

Note 1 to entry: A ciphertext may be enciphered a second time, in which case a single decipherment does not produce the original plaintext.

#### 3.2.14

#### digital signature

data appended to, or a cryptographic transformation of, a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery, e.g. by the recipient

[SOURCE: ISO 7498-2:1989]

Note 1 to entry: See cryptography.

#### **3.2.15 encipherment encryption** cryptographic transformation of data to produce ciphertext

[SOURCE: ISO 7498-2:1989]

Note 1 to entry: See cryptography.

#### **3.2.16 identification** performance of tests to enable a data processing system to recognise entities

[SOURCE: ISO/IEC 2382-8:1998]

#### 3.2.17

#### identifier

piece of information used to claim an identity, before a potential corroboration by a corresponding authenticator

[SOURCE: ENV 13608-1]

#### 3.2.18

#### integrity

proof that the message content has not been altered, deliberately or accidentally, in any way during transmission

### Note 1 to entry: Adapted from ISO 7498-2:1989. (standards.iteh.ai)

#### 3.2.19

#### key

sequence of symbols that controls the operations of encipherment and decipherment

[SOURCE: ISO 7498-2:1989]

3db7683a7667/iso-17090-1-2013

#### 3.2.20

#### key management

generation, storage, distribution, deletion, archiving, and application of keys in accordance with a security policy

[SOURCE: ISO 7498-2:1989]

#### 3.2.21

#### non-repudiation

service providing proof of the integrity and origin of data (both in an unforgeable relationship), which can be verified by any party

Note 1 to entry: Adapted from Reference.<sup>[19]</sup>

#### 3.2.22

#### private key

key that is used with an asymmetric cryptographic algorithm and whose possession is restricted (usually to only one entity)

[SOURCE: ISO/IEC 10181-1:1996]

#### 3.2.23 public kev

key that is used with an asymmetric cryptographic algorithm and that can be made publicly available

[SOURCE: ISO/IEC 10181-1:1996]

#### 3.2.24

role

set of behaviours that is associated with a task

#### 3.2.25

#### security

combination of availability, confidentiality, integrity, and accountability

[SOURCE: ENV 13608-1]

#### 3.2.26

security policy

plan or course of action adopted for providing computer security

[SOURCE: ISO/IEC 2382-8:1998]

#### 3.2.27

#### security service

service, provided by a layer of communicating open systems, which ensures adequate security of the systems or of data transfers

[SOURCE: ISO 7498-2:1989]

#### 3.3 Public key infrastructure related terms

#### 3.3.1

3.3.2

AA

#### attribute authority

### iTeh STANDARD PREVIEW (standards.iteh.ai)

authority which assigns privileges by issuing attribute certificates

[SOURCE: X.509]

<u>ISO 17090-1:2013</u>

https://standards.iteh.ai/catalog/standards/sist/b96e57b6-68c1-47a9-830c-3db7683a7667/iso-17090-1-2013

#### attribute certificate

data structure, digitally signed by an attribute authority, that binds some attribute values with identification about its holder

[SOURCE: X.509]

#### 3.3.3

#### authority certificate

certificate issued to a certification authority or to an attribute authority

Note 1 to entry: Adapted from X.509.

#### 3.3.4

**certificate** public key certificate

#### 3.3.5

#### certificate distribution

act of publishing certificates and transferring certificates to security subjects

#### 3.3.6

#### certificate extension

extension fields (known as extensions) in X.509 certificates that provide methods for associating additional attributes with users or public keys and for managing the certification hierarchy

Note 1 to entry: Certificate extensions may be either critical (i.e. a certificate-using system has to reject the certificate if it encounters a critical extension it does not recognise) or non-critical (i.e. it may be ignored if the extension is not recognised).

#### 3.3.7 certificate generation

act of creating certificates

#### 3.3.8

#### certificate management

procedures relating to certificates, i.e. certificate generation, certificate distribution, certificate archiving and revocation

#### 3.3.9

#### certificate profile

specification of the structure and permissible content of a certificate type

#### 3.3.10

#### certificate revocation

act of removing any reliable link between a certificate and its related owner (or security subject owner) because the certificate is not trusted any more, even though it is unexpired

#### 3.3.11

#### certificate holder

entity that is named as the subject of a valid certificate

#### 3.3.12

#### certificate verification

verifying that a certificate is authentic

### **iTeh STANDARD PREVIEW**

#### 3.3.13 certification

certification (standards.iteh.ai) procedure by which a third party gives assurance that all or part of a data processing system conforms to security requirements ISO 17090-1:2013

[SOURCE: ISO/IEC 288248:1998] iteh.ai/catalog/standards/sist/b96e57b6-68c1-47a9-830c-3db7683a7667/iso-17090-1-2013

#### 3.3.14 certification authority CA

#### certificate issuer

authority trusted by one or more relying parties to create and assign certificates and which may, optionally, create the relying parties' keys

Note 1 to entry: Adapted from ISO/IEC 9594-8:2008.

Note 2 to entry: Authority in the CA term does not imply any government authorisation but only denotes that it is trusted.

Note 3 to entry: Certificate issuer may be a better term, but CA is very widely used.

#### 3.3.15 certificate policy CP

named set of rules that indicates the applicability of a certificate to a particular community and/or class of application with common security requirements

#### [SOURCE: IETF/RFC 3647]

#### 3.3.16 certification practices statement CPS

statement of the practices which a certification authority employs in issuing certificates

[SOURCE: IETF/RFC 3647]
