Beständigkeit metallischer Werkstoffe gegenüber flüssigen biogenen und alternativen Brennstoffen und deren Blends

This draft Technical Report is submitted to CEN members for Vote. It has been drawn up by the Technical Committee CEN/TC 47.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a Technical Report. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a Technical Report.

European foreword

This document (FprCEN/TR 17144:2017) has been prepared by Technical Committee CEN/TC 47 “Atomizing oil burners and their components - Function - Safety - Testing”, the secretariat of which is held by DIN.

This document is currently submitted to the Vote on TR.

Introduction

Both the limited range and scope of crude oil and other fossil energy sources, as well as the impact on the climate resulting from the anthropogenic output of greenhouse gases, have led to a politically induced initiation of the restructuring of energy usage.

In addition to increasing actual efficiency in the technical utilization of fossil energy sources, the focus is on the development and expansion of renewable energies. The integration of regenerative resources in sustainable heat generation can reduce the output of greenhouse gases such as CO₂, as well as the need for fossil energy sources. As a bio-component of blends, fatty acid methyl ester (FAME) is currently used. As a result of the chemical/physical properties, as well as evaporation and combustion characteristics, experience shows that an admixture is possible up to 30 % (V/V) FAME [22, 23]. Due to the possible interactions of the blends with components and in particular with non-ferrous metals such as copper/brass, the manufacturers of consuming units and devices have approved their products only to a limited extent for such an admixture. By contrast, the manufacturers of tanks and components in the fuel piping consider their products to also be suitable for blends with higher admixtures.

However, with regard to the increasing market penetration of blends as a liquid fuel with biogenic or alternative admixtures, requirements for the materials used should be defined and stipulated as standard. There is, therefore, the need to prove the resistance of the materials used against these fuels.

1 Scope

This Technical Report includes application-relevant metallic materials of supply systems for liquid fuels and their blends with regard to corrosive or service life reducing influences. Assessment of the specialist literature showed possible interactions with biogenic and alternative fuels and motor fuels as well as their blends with mineral oil and motor fuels. The results of this assessment are given in this CEN/TR.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purpose of this document, the following terms and definitions apply.

3.1

material

raw, semi-finished or finished substance of given characteristics from which processing into a component or part is undertaken

[SOURCE: EN 16603-10-03:2014, 3.1.12, modified: deletion of “(gaseous, liquid, solid)”]

3.2

corrosion

physicochemical interaction between a metal and its environment that results in changes in the properties of the metal, and which may lead to significant impairment of the function of the metal, the environment, or the technical system, of which these form a part

[SOURCE: EN ISO 8044:2015, 2.1, modified: deletion of the note]

3.3

liquid fuel

fuel which consists of mineral fuel based fractions and which remains in its liquid state under standard temperature and pressure conditions

[SOURCE: EN 13878:2003, 3.22, modified: added mineral fuel based fractions]

3.4

liquid biogenic fuel

liquid fuel which consists 100 % (V/V) of biogenic contents

3.5

liquid alternative fuel

liquid fuel which consists 100 % (V/V) of contents that is not contained in conventional mineral fuel based liquid fuels

3.6

blend

liquid fuel consisting of mineral fuel based fractions and admixtures of liquid biogenic and/or liquid alternative fuels

FprCEN/TR 17144:2017 (E)

3.7

motor fuel

aliphatic hydrocarbon component of mineral oil

Note 1 to entry: The term “fuel” is only used in this CEN/TR for the purpose of evaluating the existing specialist literature.

Note 2 to entry: The term “motor fuel” is valid for the use in vehicles.

3.8

biodiesel

liquid motor fuel which consists 100 % (V/V) of liquid biogenic fuels

Note 1 to entry: see Clause 5 category B.

4 Materials

Table 1 lists material groups and materials, which are used in supply systems for liquid fuels. In the case of the material groups in Table 1 an evaluation of the literature has shown that the resistance against biogenic and alternative fuels and their blends may be limited.

The material groups steel, stainless steel and cast iron were not considered here as no limitation of resistance is known for these materials.

5 Liquid fuels

Three categories are specified for liquid fuels:

Category A Liquid fuels derived from petroleum refining processes with a maximum viscosity of 10 mm²/s at 20 °C, e.g. fuel category ISO-F-D according to ISO 8216-99.

NOTE 1 Liquid fuels derived from petroleum refining processes are listed in CEN/TR 15738.

Category B Liquid fuels from renewable resources, e.g. FAME according to EN 14214 or alternative fuels.

Category C Mixtures of category A and B, e.g. diesel as a motor fuel according to EN 590, EN 15940, EN 16709.

NOTE 2 For national requirements for liquid fuels, see Annex A.

6 Resistance of metallic materials to liquid biogenic and alternative fuels and their blends

Statements from the literature on the resistance of the material groups against biogenic and alternative fuels and their blends are collated in Table 2.

The test methods or test conditions of the published specialist literature references are only rarely described with precision. Therefore, an own evaluation of the resistance of the various different material groups against biogenic and alternative fuels and their blends was effected in Table 2.
