This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/TC 216.

If this draft becomes a European Standard, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

**Warning** : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

## prEN 16777:2016 (E)

### European foreword

This document (prEN 16777:2016) has been prepared by Technical Committee CEN/TC 216 “Chemical disinfectants and antiseptics”, the secretariat of which is held by AFNOR.

This document is currently submitted to the second CEN Enquiry.

[SIST EN 16777:2019](https://standards.iteh.ai/catalog/standards/sist/2890f2c1-cadd-41dc-bdac-591d4559e2f5/sist-en-16777-2019)

<https://standards.iteh.ai/catalog/standards/sist/2890f2c1-cadd-41dc-bdac-591d4559e2f5/sist-en-16777-2019>

## Introduction

This European Standard describes a surface test method for establishing whether a product proposed as a disinfectant in the fields described in Clause 1 has or does not have virucidal activity on non-porous surfaces.

The laboratory test closely simulates practical conditions of application. Chosen conditions (contact time, temperature, organisms on surfaces, etc.) reflect parameters which are found in practical situations including conditions which may influence the action of disinfectants. Each use concentration found from this test corresponds to defined experimental conditions.

The conditions are intended to cover general purposes and to allow reference between laboratories and product types. Each utilization concentration of the chemical disinfectant or antiseptic found by this test corresponds to defined experimental conditions.

However, for special applications the recommendations of use of a product can differ and therefore additional test conditions might be needed, which cannot be covered by this European Standard.

[SIST EN 16777:2019](https://standards.iteh.ai/catalog/standards/sist/2890f2c1-cadd-41dc-bdac-591d4559e2f5/sist-en-16777-2019)

<https://standards.iteh.ai/catalog/standards/sist/2890f2c1-cadd-41dc-bdac-591d4559e2f5/sist-en-16777-2019>

## 1 Scope

This European Standard specifies a test method and the minimum requirements for virucidal activity of chemical disinfectants that form a homogeneous physically stable preparation when diluted with hard water - or in the case of ready-to-use products - with water.

This European Standard applies to products that are used in the medical area for disinfecting non-porous surfaces including surfaces of medical devices without mechanical action.

This European Standard applies to areas and situations where disinfection is medically indicated. Such indications occur in patient care, for example:

- in hospitals, in community medical facilities, and in dental institutions;
- in clinics of schools, of kindergartens, and of nursing homes;

and may occur in the workplace and in the home.

It may also include services such as laundries and kitchens supplying products directly for the patients.

NOTE 1 The method described is intended to determine the activity of commercial formulations or active substances on viruses in the conditions in which they are used.

NOTE 2 This method corresponds to a phase 2, step 2 test.

EN 14885 specifies in detail the relationship of the various tests to one another and to “use recommendations”.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 14476, *Chemical disinfectants and antiseptics — Quantitative suspension test for the evaluation of virucidal activity in the medical area — Test method and requirements (Phase 2/Step 1)*

<https://standards.iteh.ai/catalog/standards/sist/2890f2c1-cadd-41dc-bdac-591d4559e2f5/sist-en-16777-2019>

EN 12353, *Chemical disinfectants and antiseptics — Preservation of test organisms used for the determination of bactericidal (including Legionella), mycobactericidal, sporicidal, fungicidal and virucidal (including bacteriophages) activity*

EN 14885, *Chemical disinfectants and antiseptics — Application of European Standards for chemical disinfectants and antiseptics*

EN 10088-1, *Stainless steels — Part 1: List of stainless steels*

EN 10088-2, *Stainless steels — Part 2: Technical delivery conditions for sheet/plate and strip of corrosion resisting steels for general purposes*

## 3 Terms and definitions

For the purposes of this document, the terms and definitions given in EN 14885 and EN 14476 apply.

#### 4 Requirements for virucidal activity on surfaces

The product shall demonstrate at least a decimal log (lg) reduction of 4 in virus titre of the *Adenovirus* and *Murine Norovirus* test strains when tested in accordance with Table 1 and Clause 5. As described in EN 14885, to claim virucidal activity against enveloped virus the product shall pass both EN 14476 and prEN 16777 with *Vaccinia Virus* and to claim limited spectrum virucidal activity the product shall pass both EN 14476 and prEN 16777 with *Adenovirus* and *Murine Norovirus*. However, to claim the virucidal activity the product shall pass standards EN 14476 with *Poliovirus*, *Adenovirus* and *Murine Norovirus* and prEN 16777 with *Adenovirus* and *Murine Norovirus*, because *Poliovirus* is not resistant to drying.

**Table 1 — Minimum and additional test conditions**

Test virus	<i>Poliovirus</i> <i>Adenovirus</i> <i>Murine Norovirus</i> Limited spectrum virucidal activity <sup>a</sup> <i>Adenovirus</i> <i>Murine Norovirus</i> <b>Virucidal activity against enveloped viruses <sup>b</sup></b> <i>Vaccinia Virus</i>
Test temperature	between 4 °C and 30 °C
Contact time	according to the manufacturer's recommendation, but not longer than 5 min or 60 min <sup>c</sup>
Interfering substances a) clean b) dirty	0,3 g/l bovine serum albumin and/or 3,0 g/l bovine serum albumin plus 3,0 ml erythrocytes
Additional conditions <sup>d</sup>	Further contact time(s), interfering substance(s) or virus(es)
<p><sup>a</sup> The test for limited spectrum virucidal activity will cover all enveloped viruses (Annex A) and the specified test organisms.</p> <p><sup>b</sup> The test for virucidal activity against enveloped virus will cover all enveloped viruses only (Annex A).</p> <p><sup>c</sup> The contact times for surface disinfectants stated in this table are chosen on the basis of the practical conditions of the product. The recommended contact time for the use of the product is within the responsibility of the manufacturer. Products intended to disinfect surfaces that are likely to come into contact with the patient and / or the medical staff and surfaces, which are frequently touched by different people, leading to the transmission of microorganisms to the patient, shall be tested with a contact time of maximum 5 min. The same applies where the contact time of the product shall be limited for practical reasons. Products for other surfaces than stated above may be tested with a contact time of maximum 60 min.</p> <p><sup>d</sup> Where appropriate (specific purposes), additional specific virucidal activity shall be determined under other conditions of time, temperature, and interfering substances (see 5.2.2.8) in accordance with 5.5, in order to take into account intended specific use conditions. Additional virus(es) can be tested, if relevant. For the additional conditions, the concentration defined as a result can be lower than the one obtained under the minimum test conditions.</p>	
NOTE <i>Poliovirus</i> cannot be used for surfaces, because of drying problems.	

The determined virucidal concentration of the test product is suggested as being suitable for practical situations of use.

## 5 Test methods

### 5.1 Principle

**5.1.1** A test suspension of viruses in a solution of interfering substances is inoculated onto a test stainless steel disc and dried. A prepared sample of the product under test is applied in a manner which covers the dried film.

The disc is maintained at a specified temperature for a defined period of time. The disc is transferred to cell maintenance medium so that the action of the disinfectant is immediately neutralised. The titre of the virus recovered from the disc is determined.

The titre of the virus on a disc treated with hard water in place of the disinfectant is also determined and the reduction in virus titre attributed to the product is calculated by difference.

**5.1.2** The test is performed using the test organisms as specified in Clause 4, Table 1.

**5.1.3** Other contact times and temperatures within the limits specified in Clause 4, Table 1 may be used. Additional interfering substances and test organisms may be used.

### 5.2 Materials and reagents, including cell cultures

#### 5.2.1 Test organisms

The virucidal activity shall be evaluated using the following strains as test organisms selected according to Clause 4, Table 1<sup>1)</sup>

a) Non-enveloped RNA virus<sup>2)</sup>

*Murine Norovirus*, strain S99 Berlin

b) Non-enveloped DNA virus

*Adenovirus* type 5, strain Adenoid 75, ATCC VR-5

c) Enveloped DNA virus

*Vaccinia virus*, strain Modified *Vaccinia Virus* Ankara (MVA), ATCC VR-1508 or strain Elstree, ATCC VR-1549

The required incubation temperature for these test organisms is  $36\text{ °C} \pm 1\text{ °C}$  or  $37\text{ °C} \pm 1\text{ °C}$  (5.3.2.12). The same temperature (either  $36\text{ °C}$  or  $37\text{ °C}$ ) shall be used for all incubations performed during a test and its control and validation.

<sup>1)</sup> The ATCC numbers are the collection numbers of strains supplied by these culture collections. This information is given for the convenience of users of this European Standard and does not constitute an endorsement by CEN of the product named.

<sup>2)</sup> Virus strains may be obtained from a national or an international culture collection. *Murine Norovirus* may be obtained from Friedrich-Loeffler-Institut Bundesforschungsanstalt für Tiergesundheit, Hauptsitz Insel Riems Südufer 10, 17493, Greifswald - Insel Riems; phone: +49 (0)38351 7-0, fax: +49 (0)38351 7-1219. <https://www.fli.de/en/home/>.

If additional test organisms are used, they shall be kept and used under optimum growth conditions (temperature, time, atmosphere, media) noted in the test report. If these additional test organisms are not classified at a reference centre, their identification characteristics shall be stated. In addition, they shall be held by the testing laboratory or national culture collection under a reference for five years.

## 5.2.2 Culture media, reagents and cell cultures

### 5.2.2.1 General

All weights of chemical substances given in this European Standard refer to the anhydrous salts. Hydrated forms may be used as an alternative, but the weights required shall be adjusted to allow for consequent molecular weight differences.

The reagents shall be of analytical grade and/or appropriate for microbiological purposes. They shall be free from substances that are toxic or inhibitory to the test organisms.

To improve reproducibility, it is recommended that commercially available – if appropriate the material is used for the preparation of culture media. The manufacturer's instructions relating to the preparation of these products should be rigorously followed.

For each culture medium and reagent, a time limitation for use should be fixed.

All specified pH values are measured at  $20\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$ .

### 5.2.2.2 Water

The water shall be freshly glass-distilled water and not demineralized water. If distilled water of adequate quality is not available, water for injections (see bibliographic reference [1]) may be used.

Sterilize in the autoclave (5.3.2.1 a)). Sterilization is not necessary if the water is used e.g. for preparation of culture media and subsequently sterilized.

See 5.2.2.7 for the procedure to prepare hard water.

### 5.2.2.3 Phosphate buffered saline (PBS)

Sodium chloride (NaCl)	8,00 g
Potassium chloride (KCl)	0,20 g
Disodium hydrogen phosphate, 12-hydrate ( $\text{Na}_2\text{HPO}_4 \times 12\text{H}_2\text{O}$ )	2,89 g
Potassium phosphate, monobasic ( $\text{KH}_2\text{PO}_4$ )	0,20 g
Water (5.2.2.2)	to 1 000,0 ml

### 5.2.2.4 Neutral Red (1:1 000 solution)

Prepare neutral red (Sigma N7005<sup>3)</sup>) stock solution at 0,1 mg/ml in water (5.2.2.2). Filter through a  $0,40\text{ }\mu\text{m}$  pore size filter and store  $4\text{ }^{\circ}\text{C}$  in the dark.

### 5.2.2.5 Foetal calf serum (FCS)

FCS has to be certified free of viruses and mycoplasma. Extraneous viruses and mycoplasma may interfere with cell and virus growth resulting in false results.

For RAW 264.7 cells, special FCS has to be used due to the cells' high sensitivity to endotoxins.

### 5.2.2.6 Trichloroacetic acid (10 % solution) (TCA)

Dissolve 10 g of TCA crystals in 80 ml of water (5.2.2.2), and then adjust the volume to 100 ml with water. Stir to complete solution.

<sup>3)</sup> Sigma N 7005 is an example of a suitable product available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by CEN of this product.
