THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

This document is circulated as received from the committee secretariat.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 27917-1 was prepared by Technical Committee ISO/TC 265, *Carbon dioxide capture, transportation and geological storage*.

ISO 27917 consists of the following parts, under the general title *Carbon dioxide capture, transportation and geological storage — Vocabulary*:

- Part 1: Cross-cutting terms
- Part 2: Specific terms and definitions relating to capture
- Part 3: Specific terms and definitions relating to transportation
- Part 4: Specific terms and definitions relating to geological storage
- Part 5: Specific terms and definitions relating to quantification and verification
- Part 6: Specific terms and definitions relating to Carbon Dioxide Storage using enhanced oil recovery.

Introduction

The objectives of this International standard ISO 27917 are the following:

- to provide a comprehensive list of terms and their definitions for carbon dioxide capture, transportation and geological storage including through EOR operation in order to facilitate communication among:
- Experts involved in the development of ISO standards on carbon dioxide capture, transportation and geological storage.
- Other carbon dioxide capture, transportation and geological storage stakeholders
- To provide the basis for common understanding for all future ISO standards for carbon dioxide capture, transportation and geological storage.

The intention is to revise ISO 27917-1 within two years after publication in order to ensure consistency with terms and definitions across ISO/TC 265 standards.

This standard is split into several parts as follows:

- Part 1: Cross-cutting terms
- Part 2: Specific terms and definitions relating to capture
- Part 3: Specific terms and definitions relating to transportation
- Part 4: Specific terms and definitions relating to geological storage
- Part 5: Specific terms and definitions relating to quantification and verification
- Part 6: Specific terms and definitions relating to Carbon Dioxide Storage using enhanced oil recovery.

This present document covers only cross-cutting terms (part 1).

Carbon dioxide capture, transportation and geological storage — Vocabulary —

Part 1: Cross-cutting terms

1 Scope

This standard defines a list of cross-cutting terms commonly used in the field of carbon dioxide capture, transportation and geological storage including through EOR operation.

The terms are classified as follows:

- General terms and definitions relating to carbon dioxide capture, transportation and storage
- General terms and definitions relating to CO₂
- General terms and definitions relating to monitoring and measuring performance in carbon dioxide capture, transportation and geological storage
- General terms and definitions relating to risk
- General terms and definitions relating to relationship with stakeholders

A list of the main acronyms used is given in [annex A.7-1](#)

<https://standards.iteh.ai/catalog/standards/sist/811e51d7-dfdb-466b-880f-ed21d470170/iso-dis-27917-1>

2 General terms and definitions relating to carbon dioxide capture, transportation and storage

2.1 carbon dioxide capture and storage CCS

process consisting of the separation of CO₂ from industrial and energy-related sources, transportation and injection into a geological formation, resulting in long term isolation from the atmosphere

Note 1 to entry: CCS is often referred to as Carbon Capture and Storage. This terminology is not encouraged because it is inaccurate: the objective is the capture of carbon dioxide and not the capture of carbon. Tree plantation is another form of carbon capture that does not describe precisely the physical process of removing CO₂ from industrial emission sources.

Note 2 to entry: The term “sequestration” is also used alternatively to “storage”. The term “storage” is preferred since “sequestration” is more generic and can also refer to biological processes (absorption of carbon by living organisms).

Note 3 to entry: Long-term means the minimum period necessary for CO₂ geological storage to be considered an effective and environmentally safe climate change mitigation option.

Note 4 to entry: The term carbon dioxide capture, utilization (or use) and storage (CCUS) includes the concept that isolation from the atmosphere could be associated with a beneficial outcome. CCUS is embodied within the definition of CCS to the extent that long term isolation of the CO₂ occurs through storage within geological formations. CCU is Carbon Capture and utilization (or use) without storage within geological formations.

Note 5 to entry: CCS should also ensure long term isolation of CO₂ from oceans, lakes, potable water supplies and other natural resources.

2.2

CCS project life cycle

entirety of phases of a CCS project from concept through the post-closure

Note 1 to entry: It includes mainly concept, design, obtaining permit, construction, operation, monitoring, measurement and verification, decommissioning, closure and post-closure (see [annex B](#)).

2.3

life cycle assessment

LCA

compilation and evaluation of the inputs, outputs and the potential environmental impacts of a CCS project or a component part throughout its life cycle

[SOURCE: adapted from ISO 14040:2006(en), [3.2](#)]

Note 1 to entry: Boundaries of the assessment include all equipment and processes necessary to evaluate a CCS project or component part. The main input and output flows may include raw materials, process gases, electricity, fossil fuels, water, CO₂, emission in air and water, solid and liquid waste, co-products, etc.

2.4

value chain

entire sequence of activities or parties that provide or receive value in the form of [products](#) or [services](#)

[SOURCE: ISO 26000:2010(en)]

2.5

CCS energy consumption

total energy used for the development, operation and decommissioning of a CCS project

Note 1 to entry: It could be expressed in GJ.

2.6

intermittency

lack of continuity in operation, as measured by the frequency or extent to which a process or installation is stopped or unavailable

Note 1 to entry: Intermittency includes variable CO₂ flows among project components.

2.7

closure period

period between the cessation of CO₂ injection and the demonstration of compliance with the criteria for site closure

2.8

post-closure period

period that begins with the demonstration of compliance with the criteria for site closure

Note 1 to entry: In some countries, demonstration of compliance may need approval from a third party.

2.9

geological storage complex

subsurface geological system extending vertically to comprise storage unit(s) and primary and secondary seals, and extending laterally to the defined limits of the CO₂ storage project

Note 1 to entry: Limits can be defined by natural geological boundaries, regulation or legal rights.

3 General terms and definitions relating to CO₂

3.1

supercritical CO₂

CO₂ at pressure greater than the critical pressure and at temperature greater than the critical temperature

3.2

dense phase CO₂

CO₂ in its liquid or supercritical phases

Note 1 to entry: Compression and transport of dense phase CO₂ are commonly achieved using pumps. Compression and transport at lower densities are commonly achieved with turbo-compressors.

Note 2 to entry: Not all supercritical CO₂ is in a dense phase and not all dense phase CO₂ is supercritical.

Note 3 to entry: Figure 1 illustrates pure CO₂ phase diagram and density plots, calculated according to Span and Wagner (1996), and plotted as a function of temperature and pressure.

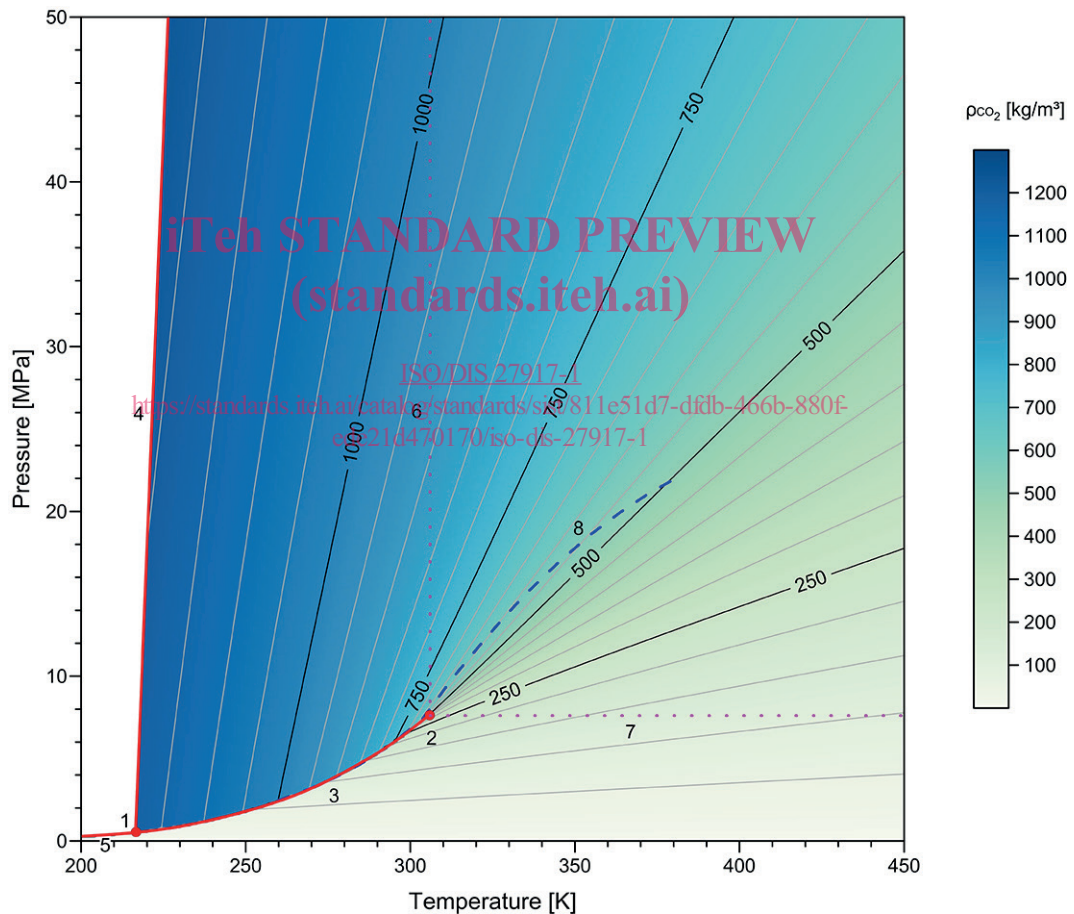

Figure 1 — Pure CO₂ phase diagram and density plots

Key

- 1 triple point
- 2 critical point
- 3 liquid-gas phase boundary
- 4 solid-(dense) fluid phase boundary
- 5 solid-(gaseous) fluid phase boundary
- 6 critical temperature
- 7 critical pressure
- 8 lower operation limit for radial pumps,

Line number 8 is shown as an example illustrating typical operation limits specific to individual pumps, according to Schwarz and Ruf, in Fishedick et al. eds. (2015) CO₂: Abtrennung, Speicherung, Nutzung. Chapter 8.4.2 CO₂ Verdichtung. Springer, Berlin, Heidelberg, 855 p.

Fluid CO₂ in the p-T-range between lines 3, 4 and 6 is often named liquid CO₂.

Fluid CO₂ in the p-T-range between lines 3, 5 and 7 is often named gaseous CO₂.

Fluid CO₂ in the p-T-range between lines 6 and 7 is often named supercritical CO₂.

Solid CO₂ in the p-T-range between lines 4 and 5 is often named dry ice.

Fluid CO₂ in the p-T-range above of lines 3 and 8 is often named dense phase CO₂.

In thermodynamic equilibrium, liquid and gaseous CO₂ do only coexist at p-T-values specified by line 3 between points 1 and 2.

3.3 critical point

highest temperature and pressure at which a pure substance (e.g. CO₂) can exist as a gas and a liquid in equilibrium

Note 1 to entry: For a multicomponent fluid mixture of a given composition, the critical point is the intersection of the bubble and the dew point curves.

3.4 critical pressure

vapour pressure at the critical temperature

Note 1 to entry: According to Span and Wagner 1996, the critical pressure for pure CO₂ is expressed in absolute pressure as 7,3773 MPa (gauge pressure 7,28 MPag).

3.5 critical temperature

temperature above which liquid cannot be formed simply by increasing the pressure

Note 1 to entry: According to Span and Wagner 1996, the critical temperature for pure CO₂ is 304,1282 K.

3.6 anthropogenic CO₂ emission

total mass of CO₂ released to the atmosphere or surface water bodies from anthropogenic sources over a specified period of time

[SOURCE: adapted from ISO 14064-2:2006, 2.5]

3.7**CO₂ equivalent**

unit for comparing the radiative forcing of a GHG to carbon dioxide

Note 1 to entry: The carbon dioxide equivalent is calculated using the mass of a given GHG multiplied by its global warming potential.

[SOURCE: ISO 14064-2:2006, 2.21]

3.8**global warming potential
GWP**

factor describing the radiative forcing impact of one mass-based unit of a given greenhouse gas relative to an equivalent unit of carbon dioxide over a specified given period of time

[SOURCE: adapted from ISO 14064-2:2006(en), 2.20]

3.9**CO₂ emission reduction**

calculated net decrease of CO₂ emissions between a baseline scenario and the CCS project output

Note 1 to entry: In most cases, a CO₂ emission reduction may be referred to as "CO₂ avoided". CO₂ avoided may also refer to CO₂ removals from the atmosphere.

[SOURCE: ISO 14064-2:2006 modified, (2.7)]

3.10**abatement**

reduction in the amount, degree or intensity of emissions of CO₂ or other pollutants

[SOURCE: adapted from IPCC]

3.11**CO₂ stream**

stream consisting overwhelmingly of carbon dioxide

Note 1 to entry: the CO₂ stream typically includes impurities and may include substances added to the stream to improve performance of CCS and/or to enable CO₂ detection.

3.12**CO₂ stream phase state**

thermodynamic state of CO₂ stream, which is a function of the composition of the stream (the chemical characteristics and proportions of the components), and the physical state of the stream (temperature, pressure and volume)

3.13**impurities**

non-CO₂ substances that are part of the CO₂ stream that may be derived from the source materials or the capture process, or added as a result of commingling for transportation, or released or formed as a result of sub-surface storage and/or leakage of CO₂

Note 1 to entry: As a subset of impurities, contaminants are non-CO₂ substances whose presence in the CO₂ stream is generally unwanted.

Note 2 to entry: As a subset of impurities, additives are substances added to the stream for the purposes of managing its physical or chemical behaviour (e.g. hydrate and corrosion inhibitors), for or from interaction with equipment (e.g. lubricants), and to track its distribution in the subsurface after injection (geochemical tracers).

3.14**pressure limit**

pre-defined extrema of pressure for safe and effective operation of components of CCS project
