## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

ISO 10077-2 was prepared by the European Committee for Standardization (CEN) Technical Committee CEN/TC 89, *Thermal performance of buildings and building components*, in collaboration with ISO Technical Committee ISO/TC 163, *Thermal performance and energy use in the built environment*, Subcommittee SC 2, *Calculation methods*, in accordance with the agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This third edition cancels and replaces the second edition (ISO 10077-2:2012), which has been technically revised to comply with the requirements for the EPB set of standards. It also incorporates the Technical Corrigendum ISO 10077-2:2012/Cor 1:2012.

In addition, [Clause 6](#) has been technically revised by

- adding a new approach for the treatment of cavities,
- separating conduction/convection and radiation, and
- introducing the radiosity method.

[Annex H](#) and [Annex G](#) were also added.

A list of all parts in the ISO 10077 series can be found on the ISO website.

## Introduction

This document is part of a series aimed at the international harmonization of the methodology for assessing the energy performance of buildings. Throughout, this series is referred to as a “set of EPB standards”.

All EPB standards follow specific rules to ensure overall consistency, unambiguity and transparency.

All EPB standards provide a certain flexibility with regard to the methods, the required input data and references to other EPB standards, by the introduction of a normative template in [Annex A](#) and [Annex B](#) with informative default choices.

For the correct use of this document, a normative template is given in [Annex A](#) to specify these choices. Informative default choices are provided in [Annex B](#).

The main target groups for this document are architects, engineers and regulators.

Use by or for regulators: In case ISO 52000-1 is used in the context of national or regional legal requirements, mandatory choices may be given at national or regional level for such specific applications. These choices (either the informative default choices from [Annex B](#) or choices adapted to national/regional needs, but in any case following the template of this [Annex A](#)) can be made available as national annex or as separate (e.g. legal) document (national data sheet).

NOTE 1 So in this case:

- the regulators will **specify** the choices;
- the individual user will apply the document to assess the energy performance of a building, and thereby **use** the choices made by the regulators

Topics addressed in this document can be subject to public regulation. Public regulation on the same topics can override the default values in [Annex B](#) of this document. Public regulation on the same topics can even, for certain applications, override the use of this document. Legal requirements and choices are in general not published in standards but in legal documents. In order to avoid double publications and difficult updating of double documents, a national annex may refer to the legal texts where national choices have been made by public authorities. Different national annexes or national data sheets are possible, for different applications.

It is expected, if the default values, choices and references to other EPB standards in [Annex B](#) are not followed due to national regulations, policy or traditions, that:

- national or regional authorities prepare data sheets containing the choices and national or regional values, according to the model in [Annex A](#). In this case a national annex (e.g. NA) is recommended, containing a reference to these data sheets;;
- or, by default, the national standards body will consider the possibility to add or include a national annex in agreement with the template of [Annex A](#), in accordance to the legal documents that give national or regional values and choices.

Further target groups are parties wanting to motivate their assumptions by classifying the building energy performance for a dedicated building stock.

More information is provided in the Technical Report (ISO/TR 52022-2) accompanying this document.

The framework for overall EPB includes:

- a) common terms, definitions and symbols;
- b) building and assessment boundaries;
- c) building partitioning into space categories;

- d) methodology for calculating the EPB (formulae on energy used, delivered, produced and/or exported at the building site and nearby);
- e) a set of overall formulae and input-output relations, linking the various elements relevant for the assessment of the overall EPB;
- f) general requirements for EPB dealing with partial calculations;
- g) rules for the combination of different spaces into zones;
- h) performance indicators;
- i) methodology for measured energy performance assessment.

ISO 10077 consists of two parts. This document is intended to provide calculated values of the thermal characteristics of frame profiles, suitable for use as input data in the calculation method of the thermal transmittance of windows, doors and shutters given in ISO 10077-1. It is an alternative to the hot box test method specified in EN 12412-2. In some cases, the hot box method can be preferred, especially if physical and geometrical data are not available or if the profile is of complicated geometrical shape.

Although the method in this document basically applies to vertical frame profiles, it is an acceptable approximation for horizontal frame profiles (e.g. sill and head sections) and for products used in sloped positions (e.g. roof windows). For calculations made with the glazing units in place, the heat flow pattern and the temperature field within the frame are useful by-products of this calculation.

The ISO 10077 series does not cover building facades and curtain walling, which are covered in ISO 12631.

[Table 1](#) shows the relative position of this document within the set of EPB standards in the context of the modular structure as set out in ISO 52000-1.

NOTE 2 In ISO/TR 52000-2, the same table can be found, with, for each module, the numbers of the relevant EPB standards and accompanying technical reports that are published or in preparation.

NOTE 3 The modules represent EPB standards, although one EPB standard could cover more than one module and one module could be covered by more than one EPB standard, for instance, a simplified and a detailed method respectively.

**Table 1 — Position of this document (*in casu* M2–5), within the modular structure of the set of EPB standards**

# Thermal performance of windows, doors and shutters — Calculation of thermal transmittance —

## Part 2: Numerical method for frames

### 1 Scope

This document specifies a method and gives reference input data for the calculation of the thermal transmittance of frame profiles and of the linear thermal transmittance of their junction with glazing or opaque panels.

The method can also be used to evaluate the thermal resistance of shutter profiles and the thermal characteristics of roller shutter boxes and similar components (e.g. blinds).

This document also gives criteria for the validation of numerical methods used for the calculation.

This document does not include effects of solar radiation, heat transfer caused by air leakage or three-dimensional heat transfer such as pinpoint metallic connections. Thermal bridge effects between the frame and the building structure are not included.

NOTE [Table 1](#) in the Introduction shows the relative position of this document within the set of EPB standards in the context of the modular structure as set out in ISO 52000-1.

### 2 Normative references

The following documents are referred to in text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 7345, *Thermal insulation — Physical quantities and definitions*

ISO 10211, *Thermal bridges in building construction — Heat flows and surface temperatures — Detailed calculations*

ISO 10292, *Glass in building — Calculation of steady-state U values (thermal transmittance) of multiple glazing*

ISO 10456:2007, *Building materials and products — Hygrothermal properties — Tabulated design values and procedures for determining declared and design thermal values*

ISO 12567-2:2005, *Thermal performance of windows and doors — Determination of thermal transmittance by hot box method — Part 2: Roof windows and other projecting windows*

ISO 17025, *General requirements for the competence of testing and calibration laboratories*

ISO 52000-1, *Energy performance of buildings — Overarching EPB assessment — Part 1: General framework and procedures*

EN 673, *Glass in building — Calculation of thermal transmittance (U-value) — Calculation Method*

EN 12519, *Windows and pedestrian doors — Terminology*

NOTE Default references to EPB standards other than ISO 52000-1 are identified by the EPB module code number and given in [Annex A](#) (normative template in [Table A.1](#)) and [Annex B](#) (informative default choice in [Table B.1](#)).

EXAMPLE EPB module code number: M5-5, or M5-5.1 (if module M5-5 is subdivided), or M5-5/1 (if reference to a specific clause of the standard covering M5-5).

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 7345, EN 12519, ISO 52000-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

#### 3.1 EPB standard

standard that complies with the requirements given in ISO 52000-1, CEN/TS 16628<sup>[10]</sup> and CEN/TS 16629<sup>[11]</sup>

Note 1 to entry: These three basic EPB documents were developed under a mandate given to CEN by the European Commission and the European Free Trade Association (Mandate M/480), and support essential requirements of EU Directive 2010/31/EU on the energy performance of buildings (EPBD). Several EPB standards and related documents are developed or revised under the same mandate.

[SOURCE: ISO 52000-1:2017, definition 3.5.14]

### 4 Symbols and subscripts

ISO 10077-2:2017  
<http://standards.iteh.ai/catalog/standards/sist/122e780e-f5f1-49f8-baf9-a2b8d90c2267/iso-10077-2-2017>

#### 4.1 Symbols

For the purposes of this document, the symbols given in ISO 52000-1 and the following apply.

Symbol	Name of quantity	Unit
<i>A</i>	area	m <sup>2</sup>
<i>b</i>	width, i.e. perpendicular to the direction of heat flow	m
<i>d</i>	depth, i.e. parallel to the direction of heat flow	m
<i>C</i>	constant in formula for Nusselt number	W/(m <sup>2</sup> ·K <sup>4/3</sup> )
<i>E</i>	intersurface emittance	—
<i>F</i>	view factor	—
<i>h</i>	heat transfer coefficient	W/(m <sup>2</sup> ·K)
<i>L<sup>2D</sup></i>	two-dimensional thermal conductance or thermal coupling coefficient	W/(m·K)
<i>l</i>	length	m
<i>Nu</i>	Nusselt number	—
<i>q</i>	density of heat flow rate	W/m <sup>2</sup>
<i>R</i>	thermal resistance	m <sup>2</sup> ·K/W
<i>r</i>	distance	m
<i>T</i>	thermodynamic temperature	K
<i>U</i>	thermal transmittance	W/(m <sup>2</sup> ·K)
<i>σ</i>	Stefan-Boltzmann constant	W/(m <sup>2</sup> ·K <sup>4</sup> )

Symbol	Name of quantity	Unit
$\varepsilon$	emissivity	—
$\lambda$	thermal conductivity	W/(m·K)
$\Psi$	linear thermal transmittance	W/(m·K)
$\theta$	temperature	°C

## 4.2 Subscripts

For the purposes of this document, the subscripts given in ISO 52000-1 and the following apply.

Subscript	Description
c	convective (surface to surface)
e	external (outdoor)
g	glazing
eq	equivalent
f	frame
fr	frame adjacent to roller shutter box
i	internal (indoor)
rb	radiation black body
m	mean
p	panel
r	radiative
s	space (air or gas space)
sb	shutter box
se	external surface
si	internal surface

## 5 Calculation method

### 5.1 Output of the method

The possible outputs of this document are the following:

- thermal transmittance of a frame profile,  $U_f$ ;
- thermal transmittance of a shutter box,  $U_{sb}$ ;
- linear thermal transmittance of a junction of a frame profile with a glazing,  $\Psi_g$  or opaque panel,  $\Psi_p$ .

### 5.2 General principle

The calculation is carried out using a two-dimensional numerical method conforming to ISO 10211. The elements shall be divided such that any further division does not change the calculated result significantly. ISO 10211 gives criteria for judging whether sufficient sub-divisions have been used.

Two different approaches for the calculation of the heat transfer through cavities are given:

- a) radiosity method;
- b) single equivalent thermal conductivity method.

The radiosity method considers that the heat transfer through an air cavity occurs simultaneously through conduction/convection and through radiation. The two phenomena are happening in parallel so that the calculation of each contribution is done separately.

When using the single equivalent thermal conductivity method the heat flow rate in cavities is represented by a single equivalent thermal conductivity,  $\lambda_{eq}$ . This equivalent thermal conductivity includes the heat flow by conduction, by convection and by radiation, and depends on the geometry of the cavity and on the adjacent materials.

NOTE The single equivalent thermal conductivity method is equal to the calculation method given in ISO 10077-2:2012.

Vertical orientation of frame sections and air cavities is assumed for calculations by this document for the purposes of assigning equivalent thermal conductivity values (see 6.4.2.3.2 and 6.4.3.4.2). This applies irrespective of the intended orientation of the actual window, including roof windows.

Throughout this document, where indicated in the text, Table C.1 shall be used to identify alternative regional references in line with ISO Global Relevance Policy.

### 5.3 Validation of the calculation programs

To ensure the suitability of the calculation program used, calculations shall be carried out on the examples described in Annexes G and H (using the radiosity method) or Annex I (using the single equivalent thermal conductivity).

The requirements for all validation cases in Annexes G and H or Annex I shall be fulfilled.

The calculated two-dimensional thermal conductance  $Z^{2D}$  for the cases in Annex H or Annex I shall not differ from the corresponding values given in Tables H.3 and H.4 or Tables I.3 and I.4 by more than  $\pm 3\%$ . This will lead to an accuracy of the thermal transmittance,  $U$ , and the linear thermal transmittance,  $\Psi$ , of about 5 %.

<https://standards.iteh.ai/catalog/standards/sist/122e780e-f5f1-49f8-baf9-a2b8d90c2267/iso-10077-2-2017>

## 6 Calculation of thermal transmittance

### 6.1 Output data

The outputs of this document are transmission heat transfer coefficients as shown in Table 2.

Table 2 — Output data

Description	Symbol	Unit	Destination module	Validity interval	Varying
Thermal transmittance of frame profile	$U_f$	W/(m <sup>2</sup> K)	M2-5	>0... 20	No
Thermal transmittance of shutter box	$U_{sb}$	W/(m <sup>2</sup> K)	M2-5	>0... 20	No
Linear thermal transmittance	$\Psi$	W/(m K)	M2-5	-20... 20	No

### 6.2 Calculation time intervals

The calculations described in this document are steady-state and do not have time intervals.

### 6.3 Input data

#### 6.3.1 Geometrical characteristics

Table 3 shows the necessary geometrical characteristics.

Table 3 — Identifiers for geometric characteristics

Description	Symbol	Unit	Range	Origin	Varying
Geometrical data					
Cross section of the frame profile				Manufacturer	No
Cross section of the shutter box				Manufacturer	No
Cross section of the junction frame profile and glazing				Manufacturer	No
Cross section of the junction frame profile and panel				Manufacturer	No

For frames with special extensions overlapping the wall or other building elements, such as Z-shaped profiles, the extensions shall be disregarded as illustrated in [Figure 1](#). This applies to all profiles with special extensions (e.g. H-shape) where the extensions overlap the wall or other building elements. Other boundaries shall be treated as defined in [Figure 4](#).

**Figure 1 — Treatment of profiles with extensions (Z-shape)**  
(standards.iteh.ai)

NOTE 1 This approximation is for assessment of thermal transmittance. It is not appropriate for the assessment of condensation risk.

NOTE 2 The extension of the frame profile is disregarded in the calculation of the thermal transmittance of the window; see ISO 10077-1.

### 6.3.2 Thermal conductivity values

For the purpose of this document, thermal conductivity values used for solid materials shall be obtained according to one of the following:

- [Table D.1](#);
- tabulated values given in ISO 10456;
- product standards;
- technical approvals by a recognized national body;
- measurements according to an appropriate International Standard.

Measurements shall be used only if there is no tabulated data or data according to relevant product standards or a technical approval. Measurements shall be performed at a mean temperature of 10 °C using the appropriate method by an institute accredited (as specified in ISO 17025) to carry out those measurements, on samples that have been conditioned at 23 °C and 50 % RH to constant mass (change in mass not more than 0,1 % over 24 h). To ensure that the thermal conductivity values are representative of the material (that is, that the value incorporates likely variability of the material and the measurement uncertainty), one of the following methods shall be used for obtaining the thermal conductivity value from measured data used in the calculations:

- the thermal conductivity is the declared value obtained from the measured data (at least three different samples from different lots representing the usual product variation, with ageing taken
