

Designation: A 832/A 832M – 99^{ε1}

Standard Specification for Pressure Vessel Plates, Alloy Steel, Chromium- Molybdenum-Vanadium¹

This standard is issued under the fixed designation A 832/A 832M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reappraisal.

^{ε1} NOTE—An editorial change was made in June 2001.

1. Scope

1.1 This specification² covers chromium-molybdenum-vanadium alloy steel plates intended primarily for the fabrication of welded pressure vessels.

1.2 The plates furnished under this specification are required to be normalized-and-tempered. Specification A 542/A 542M includes coverage of the material in the quenched-and-tempered condition.

1.3 The maximum thickness of plates furnished to this specification is limited only by the capacity of the composition to meet the specified property requirements. However, the maximum thickness of plates normally furnished under this specification is 6 in. [150 mm].

1.4 The material is intended to be suitable for fusion welding. Welding technique is of fundamental importance and it is presupposed that welding procedures will be in accordance with approved methods.

1.5 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

¹ This specification is under the jurisdiction of ASTM Committee A01 on Steel, Stainless Steel, and Related Alloys and is the direct responsibility of Subcommittee A01.11 on Steel Plates for Boilers and Pressure Vessels.

Current edition approved March 10, 1999. Published June 1999. Originally published as A 832/A 832M – 84. Last previous edition A 832/A832M – 97.

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M establishes the rules for ordering information that should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include the following:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M. If the requirements of this

⁴ Annual Book of ASTM Standards, Vol 01.01.

specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Process*—The steel shall be made by one of the processes permitted in Specification A 20/A 20M.

4.2 *Steelmaking Practice*—The steel shall be killed and shall conform to the fine grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be normalized and tempered except as allowed by 5.2. The minimum normalizing temperature for Grade 22V shall be 1650°F [900°C]. The minimum normalizing temperature for Grade 23V shall be 1850°F [1010°C]. The minimum tempering temperature shall be 1250°F [675°C].

5.2 Plates ordered without the heat treatment required by 5.1 shall be furnished in either the stress-relieved or the annealed condition. Heat treatment of plates so ordered, to conform to 5.1 and to Table 1, shall be the responsibility of the purchaser.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition shown in Table 2.

7. Mechanical Properties

7.1 *Tension Test Requirements:*

7.1.1 The material as represented by the tension test specimens shall conform to the requirements of Table 1.

7.2 *Notch Toughness Requirements:*

7.2.1 A transverse Charpy V-notch test from each plate as heat-treated shall have a minimum energy absorption value of 40 ft·lbf [54 J] average of three specimens and 35 ft·lbf [48 J] for one specimen only in the set.

TABLE 1 Tensile Requirements

Tensile strength, ksi, [MPa]	85–110 [585–760]
Yield strength, min, ksi, [MPa]	60 [415]
Elongation in 2 in. [50 mm], min, % ^A	18
Reduction of area, min, %	45 ^B
	40 ^C

^ASee Specification A 20/A 20M for elongation adjustments.

^BMeasured on round specimen.

^CMeasured on flat specimen.

TABLE 2 Chemical Requirements

Element	Composition, %		
	Grade 21V	Grade 22V	Grade 23V
Carbon			
Heat analysis	0.10–0.15	0.11–0.15	0.10–0.15
Product analysis	0.08–0.18	0.09–0.18	0.08–0.18
Manganese

Product analysis	...	0.020	NA ^B

^AApplies to both heat analysis and product analysis.

^BNA = Not Applicable.

^CRare earth metals (REM) may be added in place of calcium, subject to agreement between the product and the purchaser. In that case, the total amount of REM shall be determined and reported.

7.2.2 The notch toughness test temperature shall be 0°F [–18°C].
