

Designation: E2634 – 08

Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems¹

This standard is issued under the fixed designation E2634; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification is intended to apply to Insulating Concrete Form (ICF) Systems that will act as permanent formwork for cast-in-place reinforced concrete beams; lintels; exterior and interior, above and below grade bearing and non-bearing walls; foundation; and retaining walls. The specification is restricted to ICF Systems with a resultant uniform monolithic concrete core.

1.2 Products covered by the specification consists of molded expanded polystyrene (EPS) insulation panels that are connected by cross ties to form the ICF System.

1.3 This specification identifies test methods appropriate for establishing ICF System performance in their primary function as a stay in place concrete forming system. The use of ICF Systems covered by this specification shall be regulated by building codes that address fire performance, structural performance or both. The fire performance of the material shall be addressed through standard fire test methods established by the appropriate governing documents. The structural performance must be addressed through design of concrete structures in accordance with the appropriate Code requirements.

1.4 Details of manufacturing procedures are beyond the scope of this specification.

1.5 The values stated in SI units are to be regarded as standard. The values given in parentheses are mathematical conversions to inch-pound units that are provided for information only and are not considered standard. For conversion to metric units other than those contained in this specification, refer to [IEEE/ASTM SI 10](#).

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

ANSI/ASHRAE 90.1 Energy Standard for Buildings Except Low-Rise Residential Buildings⁸

3. Terminology

3.1 Definitions:

3.1.1 *cross ties*—plastic or metal bridging comprised of flanges and webs that hold the EPS panels at a prescribed distance and provide resistance to the concrete pressure. The flanges may be used as attachment points for interior and exterior finishing materials.

3.1.2 *expanded polystyrene*—a type of foamed plastic formed by the expansion of polystyrene resin beads in a molding process.

3.1.3 *insulating concrete forms (ICFs)*—a structural stay-in-place concrete forming system, consisting of opposing EPS panels, held parallel by means of cross ties and serves to provide insulating characteristics. See Fig. 1.

3.1.4 *quality agency*—a quality agency is defined to be one that: (1) Maintains accreditation as a Certification Organization in accordance with ISO/IEC Guide 65 and as an Inspection Agency in accordance with ISO/IEC Guide 17020. The scope of accreditations shall be consistent with the type of product being inspected. (2) Has access to the facilities and trained technical personnel to verify that the grading, bonding, workmanship, and other characteristics of the products as determined by inspection, sampling, and testing comply with all applicable requirements specified herein. (3) Has procedures to be followed by its personnel in performance of the inspection and testing. (4) Has no financial interest in, or is not financially dependent upon, any single company manufacturing the product being inspected or tested. (5) Is not owned, operated, or controlled by any such company.

3.1.5 *testing laboratory*—a testing laboratory is one that is accredited as complying with ISO/IEC Standard 17025. The scope of the laboratory's accreditation shall include the specific type of testing being performed.

4. Classification

4.1 ICF Systems addressed by this specification are those which produce a cast-in-place uniform monolithic concrete core wall where the concrete design is in accordance with accepted design standards such as ACI 318.

5. Materials and Manufacture

5.1 *EPS Panels*—All EPS panels are manufactured using molded EPS insulation, conforming to Specification C578.

5.2 *Cross Ties*—All components shall conform to manufacturing or performance standards as in accordance with 6.2. Cross ties that are susceptible to UV degradation shall have a minimum of 6 months' ultraviolet (UV) protection against degradation of physical properties.

NOTE 1—UV protection includes but is not limited to UV stabilizers, protective coverings, or other suitable means.

6. Physical Properties

6.1 Expanded Polystyrene Qualification:

FIG. 1

6.1.1 These materials, including products into which recycled material is introduced, must comply with requirements in Specification C578, Table 1.

6.1.2 *Qualification to the Requirements of 6.1.3*—Data required in 6.1.1 must be submitted in accordance with either 6.1.3 or 6.1.4.

6.1.3 Where the resin supplier provides to the quality agency sufficient test data in compliance with 6.1.1 for each resin grade (base formula) and for each Specification-C 578C578 Type intended for application use, the ICF System owner must provide reports of tests demonstrating compliance with flexural strength tested in accordance with Test Methods C203, Method I, Procedure B, and density requirements tested in accordance with Test Method D1622 of each grade and each Specification-C 578C578 Type intended for application use for each recognized manufacturing plant/location.

6.1.3.1 *Exception*—Oxygen index tests in accordance with Test Method D2863 need only be conducted on one Specification-C 578C578 Type per supplier resin grade (base formula).

6.1.3.2 *Exception*—Thermal resistance tests need only be conducted at $23.8 \pm 2.8^\circ\text{C}$ ($75 \pm 5^\circ\text{F}$).

6.1.4 Where the resin supplier does not provide, to the quality agency, sufficient test data showing compliance with all requirements of 6.1.1 for each resin grade (base formula) and for each Specification-C 578C578 Type intended for application use, the ICF System owner must provide reports of tests to demonstrate full compliance with 6.1.1 for each Specification-C 578C578 Type intended for application use at one manufacturing location.

6.1.4.1 *Exception*—Oxygen index tests in accordance with Test Method D2863 need only be conducted on one Specification-C 578C578 Type per supplier resin grade (base formula).

6.1.4.2 *Exception*—Thermal resistance tests need only be conducted at $23.8 \pm 2.8^\circ\text{C}$ ($75 \pm 5^\circ\text{F}$).

6.1.4.3 *Exception*—Where products manufactured with any one of the resin grades (base formula) already quality under 6.1.4, the ICF System owner must provide reports of tests demonstrating compliance with flexural strength tested in accordance with Test Methods C203, Method I, Procedure B, and density requirements tested in accordance with Test Method D1622 of each grade and each Specification-C 578C578 Type intended for application use for each recognized manufacturing plant/location.

6.1.5 *Surface Burning Characteristics*—The EPS shall be tested in accordance with Test Method E84 in the maximum thickness and density intended for use. The maximum Flame Spread Index shall be 75 and the maximum Smoke Development Index shall be 450.

6.1.5.1 *Exception*—The maximum Flame Spread Index shall be 25 when the product is intended for use in non-combustible construction.

6.2 Cross Tie Qualification:

6.2.1 *General*—These materials, including products into which recycled material is introduced, must comply with requirements of 6.2.2-6.2.6 of this specification which establish the base line properties of the cross ties.

6.2.2 *Rate of Burning*—Plastic Ties shall be tested in accordance with Test Method D635. The plastic shall meet minimum CC2 Classification as defined by Test Method D635, X2.1.2.

6.2.3 *Ignition Temperature*—Plastic Ties shall be tested in accordance with Test Method D1929, Procedure B. The minimum Ignition Temperature shall be 350°C (662°F).

6.2.4 *Fastener Capacity*—Shall be tested in accordance with modified Test Methods D1761 on a minimum of ten specimens.

6.2.4.1 Lateral Load Strength test specimens shall consist of full-thickness ICF panels, with the fastener for which recognition is sought, screwed into the cross-tie flange in a manner representative of the end-use configuration. The test shall be conducted with an eccentricity equal to the embedment depth of the cross tie below the surface of the EPS. Where cross ties are flush to the EPS no eccentricity is required. Pilot holes for screws shall not be predrilled into the specimen.

6.2.4.2 *Analysis:*

(1) *Plastic Cross Ties*—The allowable lateral load strength of the connection shall not exceed 75 % of the average proportional limit load, or the average ultimate load divided by a factor of 3.2, whichever is lower. The factor of 3.2 assumes a maximum coefficient of variation (COV) of 15 %. Where the COV is greater than 15 %, the allowable load shall be computed using the following equation:

$$F_{all} = F((1 - 2COV)/2.24) \quad (1)$$

where:

F_{all} = allowable load, N,

COV = s/F = coefficient of variation in a test series,

s = standard deviation in a test series, and

F = average ultimate load in test series, N.

(2) *Metal Cross Ties*—The allowable lateral strength of the connection shall be determined in accordance with AISI NAS-01, Chapter F.

6.2.4.3 *Withdrawal Load Strength (Plastic or Metal Cross Ties)*—Test specimens shall consist of full-thickness ICF panels, with the fastener for which recognition is sought, screwed into the cross-tie flange in a manner representative of the end-use configuration. Pilot holes for screws shall not be predrilled into the specimen.

(1) The ultimate load shall be determined for each test specimen.

(2) The allowable withdrawal load strength of the connection shall be determined based on the average ultimate load divided by a safety factor of 5.

6.2.5 *Cross Tie Tensile Strength*—The integrated cross tie assembly shall be tested in accordance with Test Method D638 for plastic cross ties and Test Methods E8 for metal cross ties. The minimum tensile strength of the cross tie assembly shall be equivalent to 32.3 kN/m^2 (675 lb/ft^2) of wall surface.

6.2.5.1 *Exception*—Where the manufacturer can substantiate satisfactory concrete formwork capability through analysis or testing, a reduced minimum tensile strength may be acceptable.

6.2.6 *Cross Tie Shear Strength*—The integrated cross tie assembly shall be tested in accordance with Test Method D732.
