This European Standard was approved by CENELEC on 2020-05-25. CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CENELEC member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

SIST EN IEC 63132-1:2020

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## GUIDANCE FOR INSTALLATION PROCEDURES AND TOLERANCES OF HYDROELECTRIC MACHINES –

### Part 1: General aspects

#### FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 63132-1 has been prepared by IEC technical committee 4: Hydraulic turbines.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
4/380/FDIS	4/390/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 63132 series, published under the general title *Guidance for installation procedures and tolerances of hydroelectric machines*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

**IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.**

## **iTeh STANDARD PREVIEW (standards.iteh.ai)**

[SIST EN IEC 63132-1:2020](https://standards.iteh.ai/catalog/standards/sist/4bf53e48-7566-465b-8558-0b9eae1cbbf2/sist-en-iec-63132-1-2020)

<https://standards.iteh.ai/catalog/standards/sist/4bf53e48-7566-465b-8558-0b9eae1cbbf2/sist-en-iec-63132-1-2020>

# GUIDANCE FOR INSTALLATION PROCEDURES AND TOLERANCES OF HYDROELECTRIC MACHINES –

## Part 1: General aspects

### 1 Scope

The purpose of this part of IEC 63132 is to establish, in a general way, suitable procedures and tolerances for the installation of hydroelectric turbines and generators. This document presents a typical assembly. There are many possible ways to assemble a unit. The size of the machines, design of the machines, layout of the powerhouse and delivery schedule of the components are some of the elements that could result in additional steps, the elimination of some steps and/or assembly sequences.

It is understood that a publication of this type will be binding only if, and to the extent that, both contracting parties have agreed upon it.

Installations for refurbishment projects or for small hydro projects are not in the scope of this document. An agreement between all parties is necessary.

This document excludes matters of purely commercial interest, except those inextricably bound up with the conduct of installation.

The tolerances in this document have been established upon best practices and experience, although it is recognized that other standards specify different tolerances.

Wherever this document specifies that documents, drawings or information is supplied by a manufacturer (or manufacturers), each individual manufacturer will furnish the appropriate information for their own supply only.

### 2 Normative references

There are no normative references in this document.

### 3 Terms and definitions

No terms and definitions are listed in this document.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

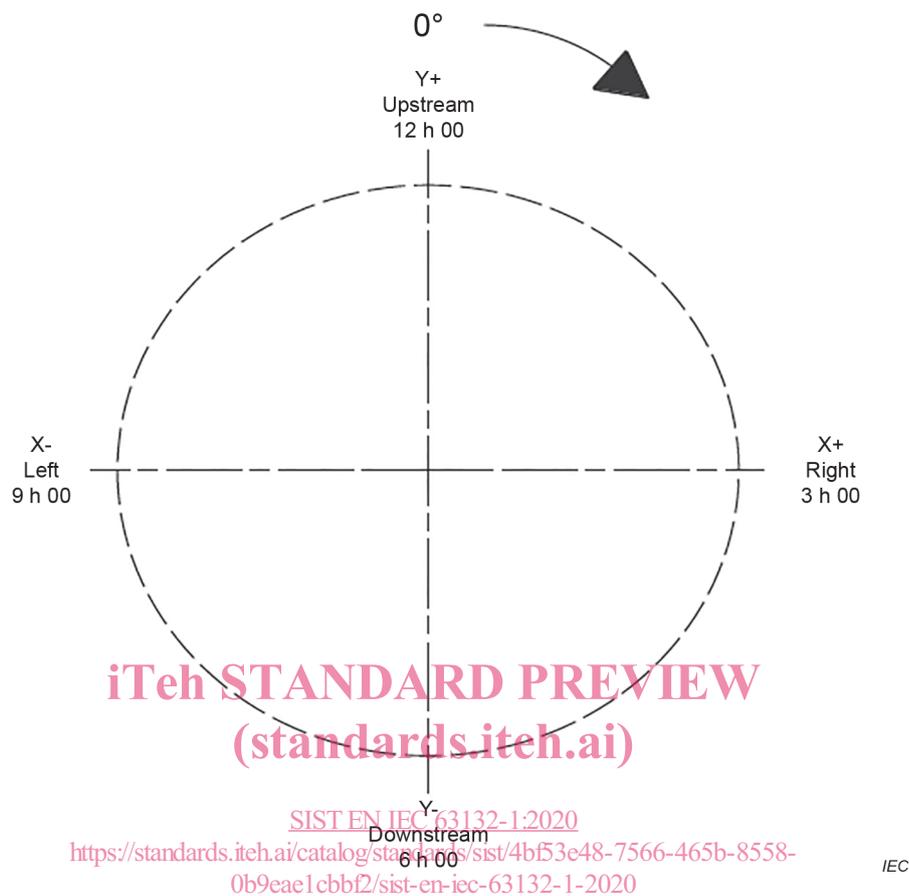

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

### 4 Concept

#### 4.1 General

For vertical units, reference axes are defined in relation to upstream, looking at the unit from the generator end (see Figure 1). Upstream corresponds to the Y+ axis, 0° and 12 h 00. The angles increase in the clockwise direction; therefore, the X+ axis corresponds to 90°, the right hand side and 3 h 00.

For horizontal units, upstream is replaced by vertical up and downstream replaced by vertical down.

**Figure 1 – Axes definition for vertical units**

#### 4.2 Reference centre

The reference centre is the best centre of the designated (or specific) component that all other components should be aligned to.

#### 4.3 Best centre

The best centre of a circular shape component corresponds to the point for which the circularity has the minimal deviation. Its location is calculated from a set of radii at equal angles and measured from the reference centre.

#### Determination:

The components  $x$  and  $y$  of the best centre from the reference centre can be calculated with the following two formulae, where  $0^\circ$  is located upstream and the angle increases clockwise:

$$x = \frac{2}{n} \sum_{i=1}^n R_i \sin(\theta_i)$$

$$y = \frac{2}{n} \sum_{i=1}^n R_i \cos(\theta_i)$$

where

$n$  is the number of readings;

$R_i$  is the measured radius;

$\theta_i$  is the angular position of each measurement.

Table 1 shows a sample calculation.

**Table 1 – Sample calculation**

Reading #	Angle	Component	X	Y	Calculated X	Calculated Y	Component centered with reference center
1	0°	99,65	0,00	99,65	-0,11	99,98	99,98
2	45°	99,95	70,68	70,68	70,57	71,01	100,11
3	90°	100,05	100,05	0,00	99,94	0,33	99,94
4	135°	100,25	70,89	-70,89	70,78	-70,55	99,94
5	180°	100,45	0,00	-100,45	-0,11	-100,12	100,12
6	225°	100,05	-70,75	-70,75	-70,86	-70,41	99,89
7	270°	100,00	-100,00	0,00	-100,11	0,33	100,11
8	315°	99,60	-70,43	70,43	-70,54	70,76	99,91
Best centre (X,Y)			0,11	-0,33	Circularity		0,22
Concentricity			0,35				
Angle			162°				

The explanation of how to calculate the best centre is given below (see Figure 2):

$$X(\#4) = 100,25 \times \sin 135^\circ = 70,89$$

$$Y(\#4) = 100,25 \times \cos 135^\circ = -70,89$$

$$bcX = \{0,00 + 70,68 + 100,05 + 70,89 + 0,00 + (-70,75) + (-100,00) + (-70,43)\} \times 2/8 = 0,11$$

$$bcY = \{99,65 + 70,68 + 0,00 + (-70,89) + (-100,45) + (-70,75) + 0,00 + 70,43\} \times 2/8 = -0,33$$

$$\text{Concentricity: } \sqrt{(0,11)^2 + (-0,33)^2} = 0,35$$

Thus the best centre of the component is located 0,11 units upstream (Y+) and 0,33 units to the left (X-) of the reference centre. Calculated radii based on the Best Centre as the new reference can be calculated in order to calculate circularity.

$$\text{Calculated } X(\#4) = X(\#4) - bcX = 70,89 - 0,11 = 70,78$$

$$\text{Calculated } Y(\#4) = Y(\#4) - bcY = -70,89 - (-0,33) = -70,55$$

$$\text{Calculated radius } (\#4) = \sqrt{(70,78)^2 + (-70,55)^2} = 99,94$$

$$\text{Circularity: max.} - \text{min.} = 100,12 - 99,89 = 0,22$$
