Plastics — Polyethylene (PE) and ethylene copolymer thermoplastics —

Part 2 :
Preparation of test specimens and determination of properties

Plastiques — Thermoplastiques à base de polyéthylène (PE) et de copolymères d'éthylène —

Partie 2 : Préparation des éprouvettes et détermination des caractéristiques

Reference number
ISO 1872-2 : 1989 (E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council. They are approved in accordance with ISO procedures requiring at least 75 % approval by the member bodies voting.

International Standard ISO 1872-2 was prepared by Technical Committee ISO/TC 61, *Plastics*.

Together with ISO 1872-1 : 1986, it cancels and replaces International Standard ISO 1872 :1972.

ISO 1872 consists of the following parts, under the general title *Plastics — Polyethylene (PE) and ethylene copolymer thermoplastics*:

— *Part 1: Designation*

— *Part 2: Preparation of test specimens and determination of properties*

Annex A of this part of ISO 1872 is for information only.

Plastics — Polyethylene (PE) and ethylene copolymer thermoplastics —

Part 2 :
Preparation of test specimens and determination of properties

1 Scope

1.1 This part of ISO 1872 specifies procedures for moulding test specimens of polyethylene materials under specified moulding conditions and methods for measuring their properties.[1)]

1.2 No figures are quoted for these properties. Those required for the designation of polyethylene materials for moulding and extrusion are given in ISO 1872-1. Other properties are determined by the appropriate methods referred to in this part of ISO 1872 and values may be obtained from manufacturers' literature. Values should only be compared if the procedures described herein for preparing the test specimens and for determining the properties are followed.

1.3 The values determined in accordance with this part of ISO 1872 will not necessarily be identical to those obtained using specimens of different dimensions and/or prepared by different procedures. They may also be influenced by colorants and other additives. The values obtained for the properties of a moulding depend on the moulding compound, the shape, the test method and the state of anisotropy. The last-mentioned depends on the gating and the moulding conditions, for example temperature, pressure and injection rate. Any subsequent treatment must also be considered, for example conditioning or annealing.

1.4 The thermal history and the internal stresses of the specimens may strongly influence the thermal and mechanical properties and the resistance to environmental stress cracking, but exert less effect on the electrical properties, which depend mainly on the chemical composition of the moulding compound.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 1872. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 1872 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

3 Preparation of test specimens

Two methods of preparation of test specimens are described: compression moulding and injection moulding.

3.1 Compression moulding

Specimens shall be prepared either by stamping or by machining from a compression-moulded sheet (see ISO 2818). Full details of compression moulding of sheet are given in ISO 293 but for polyethylene materials the following additional points shall apply:

Mould: A simple three-plate frame mould as described in ISO 293 is satisfactory for producing small sheets from which test specimens may be cut.

Predrying: No drying is normally necessary.

Moulding temperature: 180 °C ± 5 K is preferred. Other temperatures may have to be used because of the nature of the polymer, generally in the range 130 °C to 200 °C; they shall be reported.

Average cooling rate:

Method B — Standard rate:
15 $K \cdot min^{-1} \pm 5\ K \cdot min^{-1}$

Method C — Quench cooling rate:
60 $K \cdot min^{-1} \pm 30\ K \cdot min^{-1}$

Method D — Slow cooling rate:
5 $K \cdot h^{-1} \pm 0{,}5\ K \cdot h^{-1}$

Method B is preferred but, if a different rate is used because of the requirements of the user, it shall be reported.

Moulding procedure: The contact pressure time shall be 5 min to 10 min and the full-pressure time 2 min to 5 min. The demoulding temperature shall be less than or equal to 40 °C.

3.2 Injection moulding

The properties of injection-moulded test specimens depend strongly on the equipment and conditions used. At present, because of the very wide range of polyethylene materials available, it is not yet possible to standardize an injection-moulding procedure. This does not exclude the manufacture and testing of injection-moulded specimens by agreement between interested parties following the operating conditions specified in ISO 294. A guide is given in annex A.

1) To be published.

4 Determination of properties

Test specimens shall be conditioned in accordance with ISO 291, unless otherwise stated in the relevant standard, for at least 16 h at 23 °C ± 2 K prior to test. The properties shall be determined using the specimens and methods referred to in table 1.

5 Test report

When properties are determined using test specimens prepared in accordance with ISO 293 and this part of ISO 1872, the following additional information shall be included in the test report:

a) a reference to this part of ISO 1872;

b) the form of the material tested (powder, granules, pellets, specimen from a moulded part);

c) the injection-moulding conditions, equipment and type of mould used to prepare the test specimens;

d) the moulding temperature;

e) the average cooling rate;

f) details of non-standard test conditions, when used.

Table 1 — Test methods and conditions[1)]

Property	Units	Method	Specimen dimensions mm	Comments
Mechanical properties				
Tensile stress at yield[2)]	MPa	ISO/R 527	Type 2 (thickness 2)	Speed D (100 mm/min ± 10 mm/min)
Tensile stress at break[2)]	MPa	ISO/R 527	Type 2 (thickness 2)	Speed D (100 mm/min ± 10 mm/min)
Tensile elongation at yield[2)]	%	ISO/R 527	Type 2 (thickness 2)	Speed D (100 mm/min ± 10 mm/min)
Tensile elongation at break[2)]	%	ISO/R 527	Type 2 (thickness 2)	Speed D (100 mm/min ± 10 mm/min)
Tensile elastic modulus[3)]	MPa	ISO/R 527	Type 2 (thickness 2)	Speed A (1 mm/min ±0,5 mm/min)
Flexural modulus at 1 % strain	MPa	ISO 178	80 × 10 × 4	Test speed: 2 mm/min ± 0,5 mm/min
Shear modulus and mechanical loss factor	MPa	ISO 537	60 × 10 × 1	
Tensile creep modulus[3)]	MPa	ISO 899	ISO/R 527 type 2 (thickness 2)	
Flexural creep modulus[3)]	MPa	ISO 6602	80 × 10 × 4	
Izod impact resistance[4)] vs temperature	kJ/m²	ISO 180	80 × 10 × 4	Method ISO 180/1A
Charpy impact resistance[5)] vs temperature	kJ/m²	ISO 179	80 × 10 × 4	Method ISO 179/1A
Ball indentation hardness	N/mm²	ISO 2039-1	Minimum thickness 4	
Rockwell hardness		ISO 2039-2	Minimum thickness 4	
Shore A or D hardness		ISO 868	Minimum thickness 4	
Thermal properties				
Deflection temperature under load[6)]	°C	ISO 75	110 × 10 × 4	Method B
Vicat softening temperature (VST)	°C	ISO 306	25 × 25 × 4	Method A (50 K/h)
Brittleness temperature	°C	ISO 974	20 × 2,5 × 1,6	
Electrical properties				
Surface resistance	Ω	IEC 93		
Volume resistivity	Ω·cm	IEC 93		
Dielectric strength	kV/mm	IEC 243		
Relative permittivity		IEC 250		
Dissipation factor		IEC 250		
Comparative tracking index		IEC 112		Solution A
Ageing properties				
Natural weathering		ISO 4607 / ISO 4582		
Artificial-light weathering		ISO 4892 / ISO 4582		
Miscellaneous properties				
Melt flow rate (MFR)	g/10 min	ISO 1133	Test done on granules or powder	See also ISO 1872-1
Density of moulded pieces	g/cm³	ISO 1183	Pieces from ISO/R 527 specimen	For conventional density, see ISO 1872-1
Water absorption	mg	ISO 62		
Gas transmission rate	cm³/(m²·d·atm)	ISO 2556		
Effect of liquid chemicals		ISO 175		
Viscosity number	ml/g	ISO 1628-3	Test done on granules or powder	
Environmental stress cracking[7)]				
— Ball or pin method	h	ISO 4600	80 × 10 × 4	
— Constant tensile stress method	h	ISO 6252	80 × 10 × 4	
— Bent strip method	h	ISO 4599	80 × 10 × 4	

1) Preferred specimens and conditions are given, but some alternatives are indicated in these footnotes. It is intended to make the preferred conditions mandatory at the next revision.

2) Speed D is preferred. Alternative speeds, for example 50 mm/min, may be used but shall be reported.

3) A graph of modulus against time at specified temperatures and stresses is recommended.

4) Method 180/1A is preferred. Method 180/4A is an alternative, but its use shall be reported.

5) Method 179/1A is preferred, with a distance between supports of 60 mm. Methods 179/1C and 2C are alternatives, but their use shall be reported.

6) 110 mm × 10 mm × 4 mm is the preferred specimen size. A 110 mm × 12,7 mm × 4 mm specimen is an alternative, but its use shall be reported.

7) These tests are not applicable to all grades of polyethylene.

Annex A
(informative)

Moulding conditions for preparing test specimens of polyethylene injection-moulding materials with a conventional density greater than 940 kg/m³

Mould temperature	30 °C ± 5 K
Average injection speed	110 mm/s ± 30 mm/s
Melt temperature	190 °C ± 5 K for an MFR ⩾ 1 g/10 min
	210 °C ± 5 K for an MFR < 1 g/10 min
Injection hold (dwell) time	20 s minimum
Cooling time	40 s minimum
Total cycle time	65 s minimum

The injection time should be set so that no flash, sink marks or voids are produced in the specimens.
