Foreword

This European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) of the European Telecommunications Standards Institute (ETSI).

This ETS specifies the AT command for terminal equipments being used within the digital cellular telecommunications system.

The contents of this ETS is subject to continuing work within SMG and may change following formal SMG approval. Should SMG modify the contents of this ETS, it will be resubmitted for OAP by ETSI with an identifying change of release date and an increase in version number as follows:

Version 5.x.y

where:

- y the third digit is incremented when editorial only changes have been incorporated in the specification;
- x the second digit is incremented for all other types of changes, i.e. technical enhancements, corrections, updates, etc.

| Transposition dates | |
|---|-----------------|
| Date of adoption of this ETS: | 23 October 1998 |
| Date of latest announcement of this ETS (doa): | 31 January 1999 |
| Date of latest publication of new National Standard or endorsement of this ETS (dop/e): | 31 July 1999 |
| Date of withdrawal of any conflicting National Standard (dow): | 31 July 1999 |

Introduction <https://standards.iteh.ai/catalog/standards/sist/b019cbae-ad94-43a9-b1fb-892b87c2f1cc/sist-ets-300-916-e5-2003>

The present document includes some references to features which are not part of the original Phase 2+ release of the GSM Technical specifications. All subclauses and text which were changed as a result of these features contain a marker (see table below) relevant to the particular feature. GSM 10.01 will contain further information about these markers and GSM yearly releases.

The following table lists all new features that were introduced to this document after version 5.4.0. Changes that were made as corrections to existing features are not listed in this table.

NOTE: following a decision made at ETSI SMG #25 requiring that all specifications containing a release 97 workitem be released as a version 6.0.0. Consequently, new release 97 features approved at or after ETSI SMG #25 are found only in the version 6.x.y of the present document.

| Feature | Designator |
|--|-----------------|
| Technical enhancement and improvement: New AT-commands | \$(AT R97)\$ |
| Support of Multiplexer according to GSM 07.10 | \$(MUX MS-TE)\$ |

(standards.iteh.ai)**

SIST ETS 300 916 E5:2003

<https://standards.iteh.ai/catalog/standards/sist/b019cbae-ad94-43a9-b1fb-892b87c2f1cc/sist-ets-300-916-e5-2003>

1 Scope

This European Telecommunication Standard (ETS) specifies a profile of AT commands and recommends that this profile be used for controlling Mobile Equipment (ME) functions and GSM network services from a Terminal Equipment (TE) through Terminal Adaptor (TA). The command prefix +C is reserved for Digital Cellular in ITU-T Recommendation V.25ter [14]. This ETS has also the syntax details used to construct these extended GSM commands. Commands from ITU-T Recommendation V.25ter [14] and existing digital cellular standards (TIA IS-99 [15] and TIA IS-135 [16]) are used whenever applicable. Some of the new commands are defined such way that they can be easily applied to ME of networks other than GSM. ITU-T T.31 [11] and T.32 [12] fax AT commands may be used for GSM fax transmission from TE. GSM Short Message Service AT commands are defined in GSM 07.05 [24]. GPRS AT commands are defined in GSM 07.60 [34]. This ETS assumes an abstract architecture comprising a TE (e.g. a computer) and a ME interfaced by a TA (see figure 1). The span of control of the defined commands should allow to handle any physical implementation that this abstract architecture may lead to:

- TA, ME and TE as three separate entities;
- TA integrated under the ME cover, and the TE implemented as a separate entity;
- TA integrated under the TE cover, and the ME implemented as a separate entity;
- TA and ME integrated under the TE cover as a single entity.

The commands described in this ETS may be observed on the link between the TE and the TA. However, most of the commands retrieve information about the ME, not about the TA.

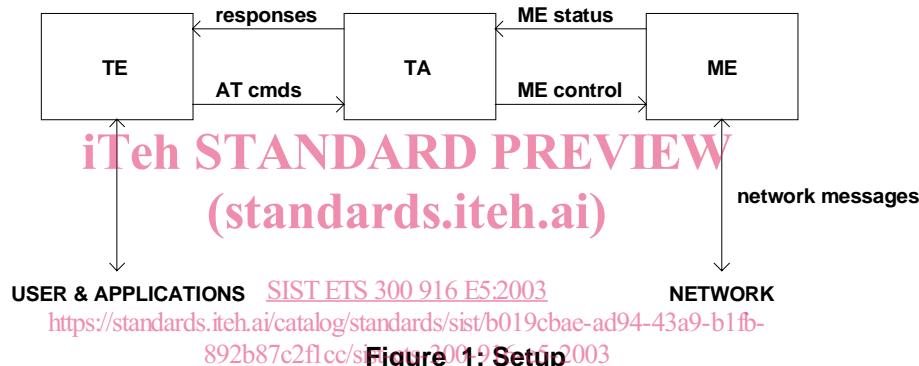

Figure 1. Setup

Interface between TE and TA is intended to operate over existing serial (ITU-T Recommendation V.24) cables, infrared link, and all link types with similar behaviour. For correct operation many of the defined commands require eight bit data and therefore it is recommended that TE-TA link is set to eight bits/ byte mode. (For infrared operation implementation refer informative references IrDA. For embedding AT commands and data during on-line data state refer TIA-617/ITU-T V.80.) Interface between TA and ME is dependent on the interface in the ME.

2 References

This ETS incorporates by dated and undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this ETS only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

3 Abbreviations and definitions

3.1 Abbreviations

For the purposes of this ETS, the following abbreviations apply:

| | |
|-------|--|
| AT | ATTention; this two-character abbreviation is always used to start a command line to be sent from TE to TA |
| BCD | Binary Coded Decimal |
| ETSI | European Telecommunications Standards Institute |
| HSCSD | High Speed Circuit Switched Data |
| IMEI | International Mobile station Equipment Identity |
| IRA | International Reference Alphabet (ITU-T T.50 [13]) |
| IrDA | Infrared Data Association |
| ISO | International Standards Organisation |

| | |
|-------|---|
| ITU-T | International Telecommunication Union - Telecommunications Standardization Sector |
| ME | Mobile Equipment, e.g. a GSM phone (equal to MS; Mobile Station) |
| MoU | Memorandum of Understanding (GSM operator joint) |
| PCCA | Portable Computer and Communications Association |
| RDI | Restricted Digital Information |
| RLP | Radio Link Protocol |
| SIM | Subscriber Identity Module |
| TA | Terminal Adaptor, e.g. a GSM data card (equal to DCE; Data Circuit terminating Equipment) |
| TE | Terminal Equipment, e.g. a computer (equal to DTE; Data Terminal Equipment) |
| TIA | Telecommunications Industry Association |
| UDI | Unrestricted Digital Information |

3.2 Definitions

For the purposes of this ETS, the following syntactical definitions apply (refer also clause 4):

| | |
|------------------|--|
| <CR> | Carriage return character, which value is specified with command S3. |
| <LF> | Linefeed character, which value is specified with command S4. |
| <...> | Name enclosed in angle brackets is a syntactical element. Brackets themselves do not appear in the command line. |
| [...] | Optional subparameter of a command or an optional part of TA information response is enclosed in square brackets. Brackets themselves do not appear in the command line. When subparameter is not given in <i>parameter type</i> commands, new value equals to its previous value. In <i>action type</i> commands, action should be done on the basis of the recommended default setting of the subparameter. (standards.iteh.ai) |
| <u>underline</u> | Underlined defined subparameter value is the recommended default setting of this subparameter. In <i>parameter type</i> commands, this value should be used in factory settings which are configured by V.25ter [14] command &F0. In <i>action type</i> commands, this value should be used when subparameter is not given. |

4 AT command syntax

This clause summarizes general aspects on AT commands and issues related to them. For further information refer ITU-T Recommendation V.25ter [14].

4.1 Command line

See figure 2 for general structure of a command line. Standardized *basic commands* are found only in V.25ter [14]. GSM commands use syntax rules of *extended commands*. Every extended command has a *test command* (trailing =?) to test the existence of the command and to give information about the type of its subparameters. *Parameter type* commands also have a *read command* (trailing ?) to check the current values of subparameters. *Action type* commands do not store the values of any of their possible subparameters, and therefore do not have a read command.

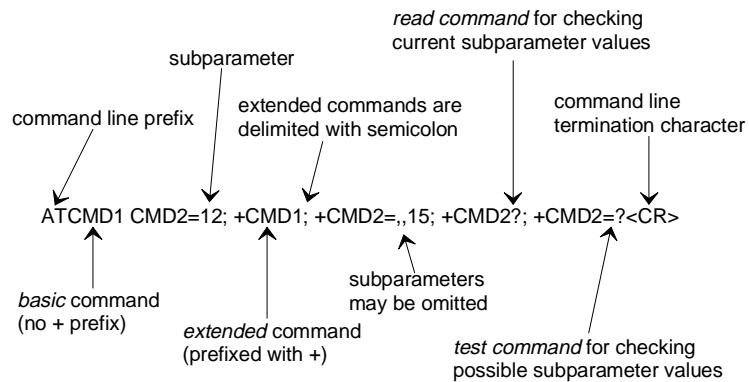

Figure 2: Basic structure of a command line

If verbose responses are enabled with command V1 and all commands in a command line has been performed successfully, result code <CR><LF>OK<CR><LF> is sent from the TA to the TE. If numeric responses are enabled with command V0, result code 0<CR> is sent instead.

If verbose responses are enabled with command V1 and subparameter values of a command are not accepted by the TA (or command itself is invalid, or command cannot be performed for some reason), result code <CR><LF>ERROR<CR><LF> is sent to the TE and no subsequent commands in the command line are processed. If numeric responses are enabled with command V0, result code 4<CR> is sent instead. ERROR (or 4) response may be replaced by +CME ERROR: <err> (refer clause 9) when command was not processed due to an error related to ME operation.

4.2 Information responses and result codes

iTeh STANDARD PREVIEW

The TA response for the example command line of figure 2 could be as shown in figure 3. Here, verbose response format is enabled with command V1. If numeric format V0 would have been used, <CR><LF> headers of *information responses* would have been left out and *final result code* changed to 0<CR>.

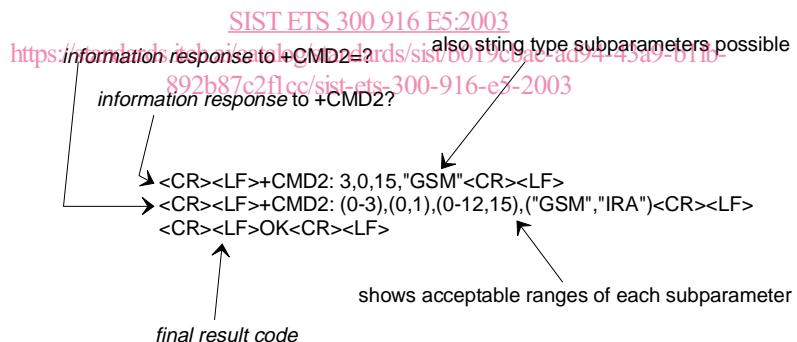

Figure 3: Response to a command line

So called *intermediate result codes* inform about progress of TA operation (e.g. connection establishment CONNECT), and so called *unsolicited result codes* indicate occurrence of an event not directly associated with issuance of a command from TE (e.g. ring indication RING).

4.3 ITU-T V.25ter [14] TE-TA interface commands

Table 1 summarizes V.25ter [14] commands relating to command line and response formatting, and TA-TE interface operation. All are applicable to GSM terminals.
