COMMITTEE DRAFT FOR VOTE (CDV)

PROJECT NUMBER: IEC 62832-2 ED1	
DATE OF CIRCULATION: 2019-11-29	CLOSING DATE FOR VOTING: 2020-02-21
SUPERSEDES DOCUMENTS: 65/708/CD,65/727A/CC	

IEC TC 65 : INDUSTRIAL-PROCESS MEASUREMENT, CONTROL AND AUTOMATION	
SECRETARIAT: France	SECRETARY: Mr Rudy BELLIARDI
OF INTEREST TO THE FOLLOWING COMMITTEES: SC 3D,SC 65E,SyC SM	PROPOSED HORIZONTAL STANDARD: <input type="checkbox"/> Other TC/SCs are requested to indicate their interest, if any, in this CDV to the secretary.
FUNCTIONS CONCERNED: <input type="checkbox"/> EMC <input type="checkbox"/> ENVIRONMENT <input type="checkbox"/> QUALITY ASSURANCE <input type="checkbox"/> SAFETY	
<input checked="" type="checkbox"/> SUBMITTED FOR CENELEC PARALLEL VOTING Attention IEC-CENELEC parallel voting The attention of IEC National Committees, members of CENELEC, is drawn to the fact that this Committee Draft for Vote (CDV) is submitted for parallel voting. The CENELEC members are invited to vote through the CENELEC online voting system.	<input type="checkbox"/> NOT SUBMITTED FOR CENELEC PARALLEL VOTING

This document is still under study and subject to change. It should not be used for reference purposes.

Recipients of this document are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

TITLE:
Industrial-process measurement, control and automation - Digital Factory framework - Part 2: Model elements

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**INDUSTRIAL-PROCESS MEASUREMENT, CONTROL AND AUTOMATION –
Digital Factory framework****Part 2: Model elements****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62832-2 has been prepared by IEC technical committee 65: Industrial-process measurement, control and automation.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
XX/XX/FDIS	XX/XX/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts of the IEC 62832 series, published under the general title, *Industrial-process measurement, control and automation – Digital Factory framework*, can be found on the IEC website.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

The National Committees are requested to note that for this publication the stability date is 2024

THIS TEXT IS INCLUDED FOR THE INFORMATION OF THE NATIONAL COMMITTEES AND WILL BE DELETED AT THE PUBLICATION STAGE.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

SIST EN IEC 62832-2:2021

<https://standards.iteh.ai/catalog/standards/sist/c73706c5-0152-40a1-84e1-b1b1f5ec7fd1/sist-en-iec-62832-2-2021>

INTRODUCTION

IEC 62832 provides a framework used for establishing and maintaining the digital representations of production systems, including the representation of the elements of the production systems and of the relationships between these elements. The framework is intended also to support the exchange of information about these elements.

The framework aims at reducing the interoperability barriers for exchange of information for the various activities related to production systems. The main advantages of this method are that all information related to a production system is described in a standardized manner, and it can be used and modified through its entire life cycle. The method defined in IEC 62832 is kept as generic as possible in order to enable its use in several industrial sectors.

While IEC 62832-1 describes the general principles of the DF reference model together with its most important model elements, this part of IEC 62832 provides a technology-independent definition of all model elements of the DF reference model.

The intention of this document is to provide a common base for implementation of the DF framework using different technologies (for example different dictionary technologies and different engineering data formats).

The data type specification provided with this document is intended to allow mapping of the DF framework to different dictionaries.

Two types of templates for representation, namely for specific DataElementTypes and for model elements, are described in 3.3. Based on these templates, definitions of specific DataElementTypes are given in Clause 4, and definitions of model elements, using the DataElementTypes are given in Clause 5.

The requirements for these two sets of definitions are kept to as minimal as possible, in order to allow broad use of the framework.

If the concepts of DF framework are applied to provide model elements for different engineering domains, domain-specific data specifications will be used (for example based on IEC 62656-1).

INDUSTRIAL-PROCESS MEASUREMENT, CONTROL AND AUTOMATION –

Digital Factory framework Part 2: Model elements

1 Scope

This part of IEC 62832 specifies detailed requirements for model elements of the Digital Factory framework. It defines the nature of the information provided by the model elements, but not the format of this information.

NOTE General requirements for the main model elements of the DF reference model are specified in IEC 62832-1.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 62832-1:—¹, *Industrial-process measurement, control and automation – Digital factory framework – Part 1: General principles*

ISO TS 29002-5:2009, *Industrial automation systems and integration – Exchange of characteristic data – Part 5: Identification scheme*

ISO/IEC 6523 (all parts), *Information technology – Structure for the identification of organizations and organization parts*

IETF RFC 3986, *Uniform Resource Identifier (URI): Generic Syntax*, available at <<http://www.ietf.org>>

3 Terms, definitions, (symbols,) abbreviated terms and conventions

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 62832-1 apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.2 Abbreviated terms

For the purposes of this document, the following abbreviated terms apply.

CDEL	Collection of Data Elements
DER	Data Element Relationship
DET	Data Element Type (see IEC 62832-1)

¹ Under preparation

130	DF	Digital Factory (as qualifier)
131	DLOP	Device List of Properties (see IEC 61987-10)
132	IC	Item Code (see IEC 62832-1)
133	ID	Identifier
134	IRDI	International Registration Data Identifier (see ISO TS 29002-5)
135	LOP	List of Properties (see IEC 61987-10)
136	OLOP	Operational List of Properties (see IEC 61987-10)
137	PS	Production System (as qualifier)
138	UML	Unified Modeling Language (see ISO/IEC 19505-1)
139	URI	Uniform Resource Identifier (see IETF RFC 3986)
140	VI	Version Identifier (see IEC 62832-1)

141 NOTE 1 The abbreviated term DF is only used as a qualifier for model elements specified in this document. It is not
 142 to be understood as a replacement for the Digital Factory concept defined in IEC 62832-1:—, 3.1.19.

143 NOTE 2 The abbreviated term PS is only used as a qualifier for model elements specified in this document. It is not
 144 to be understood as a replacement for the production system concept defined in IEC 62832-1:—, 3.1.24.

145

146 3.3 Conventions for representing the definition of a model element

147 3.3.1 Convention for names

148 While IEC 62832-1 is using general names for describing the concepts, IEC 62832-2 and
 149 IEC 62832-3 define more formal requirements. In order to clearly identify the names of the
 150 model elements the documents IEC 62832-2 and IEC 62832-3 use 'PascalCase' for names.

151 A help for matching the names is provided in Table B.1.

152 3.3.2 Representation of specific DataElementTypes

153 The template used in this document for representing the definition of specific
 154 DataElementTypes of the DF reference model is specified in Table 1.

155 NOTE Definitions in this document are independent of actual definitions of model elements in any specific
 156 dictionary.

157 **Table 1 – Template for representing the definition of specific DataElementTypes**

ItemCode	
VersionIdentifier	
PreferredName	
DFMdataType	
Description	

158

159 Table 1 shows the mandatory fields for defining a specific DataElementType. Optionally,
 160 additional fields may be provided (for example SynonymousName, LetterSymbol,
 161 PermissibleValues, PhysicalUnit and DETcategory).

162 Each shaded cell indicates the name of a corresponding field (the value of the field is shown
 163 as unshaded cell).

164 The template provides the definition of a specific DataElementType (identity and meaning). It
 165 is formatted as fields with respective values. The fields have names of model elements defined

in this document, because the template is intended to be used accordingly when the specific DataElementTypes are registered in a ConceptDictionary.

A specific DataElementType is defined by providing data in the relevant fields (i.e. the table is filled). A “-” in an unshaded cell indicates that the field is not applicable to the definition of the specific DataElementType.

3.3.3 Representation of the definition of model elements

The template used in this document for representing the definition of model elements of the DF reference model is specified in Table 2.

Table 2 – Template for representing the definition of model elements

ItemCode				
VersionIdentifier				
PreferredName				
LetterSymbol				
Description				
ParentModelElement				
Structure				
Structure element	I/R	Cardinality	Conditions	Remarks

The upper part of the template provides the definition of a model element (identity and meaning). It is formatted as fields with respective values. The fields use names of model elements defined in this document, because these fields are intended to be used accordingly when the model elements will be registered in a ConceptDictionary. The ItemCode and VersionIdentifier fields can be used to uniquely identify a model element within the DF framework.

The structure of the model element is represented in the lower part of the template as a list of constituent elements. Each constituent element in the template may be instantiated as a constituent of the defined model element, depending on cardinality and conditions. Constituent elements inherited from the ParentModelElement are not listed.

The field “Structure element” contains a reference to a model element definition. The constituent element is derived from the referenced model element definition.

A constituent element may be defined as an instance of a model element or as a reference to an instance of a model element.

The field “I/R” contains a text string (“I”, “R” or “I/R”), which indicates whether the constituent element is defined as an instance or as a reference:

- the value “I” indicates that the structure contains an instance of the particular constituent element (or multiple instances depending on the value of the cardinality);
- the value “R” indicates that the structure contains a reference to an instance of the particular constituent element (or multiple references depending on the value of the cardinality);
- the value “I/R” indicates that the structure contains either an instance of or a reference to an instance of the particular constituent element (or multiple ones depending on the value of the cardinality).
