English Version

## Home and Building Electronic Systems (HBES)- Part 6-2 IoT Semantic Ontology\_Model\_Description

To be completed

To be completed

This draft European Standard is submitted to CENELEC members for enquiry.  
Deadline for CENELEC: 2020-06-12.

It has been drawn up by CLC/TC 205.

If this draft becomes a European Standard, CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CENELEC in three official versions (English, French, German).  
A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

European Committee for Electrotechnical Standardization  
Comité Européen de Normalisation Electrotechnique  
Europäisches Komitee für Elektrotechnische Normung

## 24 **European foreword**

25 This document (prEN 50090-6-2:2020) has been prepared by CLC/TC 205 “Home and Building  
26 Electronic Systems (HBES)”.

27 This document is currently submitted to the Enquiry.

28 The following dates are proposed:

- latest date by which the existence of this document has to be announced at national level (doa) dor + 6 months
- latest date by which this document has to be implemented at national level by publication of an identical national standard or by endorsement (dop) dor + 12 months
- latest date by which the national standards conflicting with this document have to be withdrawn (dow) dor + 36 months (to be confirmed or modified when voting)

## **iTeh STANDARD PREVIEW (standards.iteh.ai)**

<https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-4c4916487403/osist-pren-50090-6-2-2020>

## 29 **1 Scope**

30 This document defines the HBES Information Model and a corresponding data exchange format for  
31 the Home and Building HBES Open Communication System.

## 32 **2 Normative references**

33 The following documents are referred to in the text in such a way that some or all of their content  
34 constitutes requirements of this document. For dated references, only the edition cited applies. For  
35 undated references, the latest edition of the referenced document (including any amendments)  
36 applies.

37 EN 50090-1, *Home and Building Electronic Systems (HBES) - Part 1: Standardization structure*

## 38 **3 Terms, definitions and abbreviations**

### 39 **3.1 Terms and definitions**

40 For the purposes of this document, the terms and definitions given in EN 50090-1 apply.

41 ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- 42 • IEC Electropedia: available at <http://www.electropedia.org/>
- 43 • ISO Online browsing platform: available at <http://www.iso.org/obp>

### 44 **3.2 Abbreviations**

45 For the purposes of this document, the following abbreviations apply.

IoT	Internet of Things	<a href="https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-66b614141414/sist-pr-en-50090-6-2-2020">https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-66b614141414/sist-pr-en-50090-6-2-2020</a>
HBES	Home and Building Electronic Systems	<a href="https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-66b614141414/sist-pr-en-50090-6-2-2020">https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-66b614141414/sist-pr-en-50090-6-2-2020</a>

## 46 **4 HBES Information Model (Ontology)**

### 47 **4.1 Motivation**

48 The current HBES model/ data information is based on XML, is managed by the KNX Association and  
49 has its corresponding versioning. Project/ product data exported by existing HBES management  
50 clients are in line with this XML schema.

51 Even if XML itself is a well-known and widespread format, it has its drawbacks in the context of  
52 sharing model/ project data information with external clients using this data. HBES management  
53 clients use the XML schema mainly to define the corresponding data structures to store/ export  
54 project and product data. Consequently, the XML schema is always updated when a new  
55 management client version is published, when new project and/or product features demand also a  
56 change of the data structures. This requires always a synchronization with the external clients to  
57 announce new XML schema versions.

58 The aim and motivation is to define a HBES Information Model and a corresponding data exchange  
59 format:

- 60 — The model expresses only the current - by external clients requested - information
- 61 — The model can be also easily updated
- 62 — The exported data uses a widely used data exchange format, which should also be readable by  
63 humans, means they are a text based.

64 This model and data exchange format is more stable, compared to the frequent HBES management  
65 client evolution.

66 — The HBES Information Model will be available as ontology in one or more formats, such as turtle  
67 files.

68 — The data exported by HBES management clients will be available as linked data, such as JSON-  
69 LD files.

70 The HBES IoT protocol suite shall support semantic information, both for runtime as well as for  
71 configuration.

72 This information shall be brought to the system components in a data driven way, by the HBES  
73 management clients software and possible other sources. It shall thus build on the information  
74 provided by the HBES management clients user, to avoid having to be entered again in the 3<sup>rd</sup> Part  
75 Client configuration.

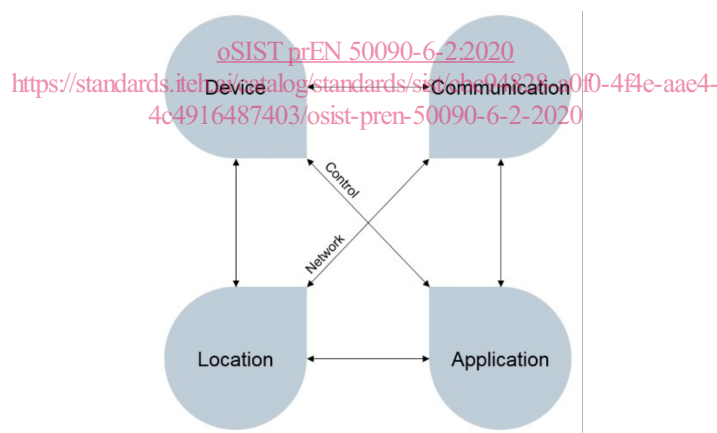

76 The semantic information shall comply with the HBES standard and be available as public  
77 information. Technically this information will be available as linked data, expressed with triples.

78 The use of semantics itself allows to formalize, restrict, and verify the usage of HBES subjects to  
79 describe entities, relationships, and tags (entities have some relationship predicate to some other  
80 entities— essentially a directed edge in a graph).

81 This simple (triple) structure enables the succinct and elegant composition of large, interconnected  
82 structures of facility (building) subsystems.

## 83 4.2 Introduction

84 The HBES system is designed for direct exchange of information (i.e. communication) between  
85 networked devices controlling applications in and around buildings. See Figure 1.

86

87

**Figure 1 — HBES environment**

88 These different aspects of the HBES environment are reflected by an individual “model” for Location,  
89 Devices, Applications as well as the Communication for exchange of control information. All individual  
90 model parts together form the entire HBES IoT Information Model as a single ontology. Ontologies are  
91 a structured way to describe the meaning of data and should not be mixed up with common data  
92 model structures. Ontologies work with the term “concepts” to describe things that have a real-world  
93 commonality. In the ontology itself such things are expressed technically as ontology classes.

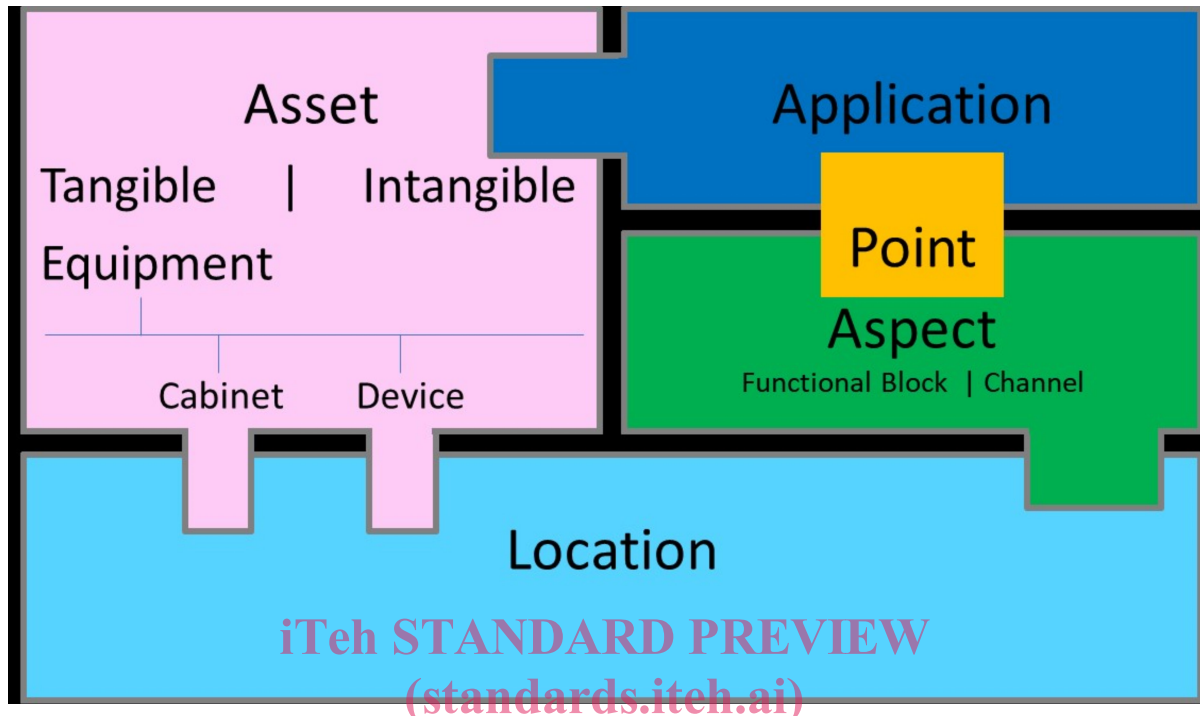

94 For simplification the term model will be used further down. Figure 2 describes the HBES Information  
95 Model parts. It contains the following:

96 — Equipment (devices and other physical assets)

97 — Application Software (software to run the intended system behaviour)

## prEN 50090-6-2:2020

- 98 — Point (interface to interact with data points mainly provided by devices)
- 99 — Aspects (grouped points that identify a specific view/perspective to the system)
- 100 — Location (structural building elements)

101

102

**Figure 2 — HBES Information Model**

oSIST prEN 50090-6-2:2020

103 The HBES Information Model builds upon other work in several ways.

104 It is inspired by the BRICK concept to model Points, Equipment and Context and their relationships.

105 It can be extended with tagging vocabulary such as Haystack.

106 In addition, it uses the location concepts from IFC and allows a semantic representation to utilize its  
 107 flexibility and extensibility. For this the HBES Information Model supports an explicit mapping to IFC  
 108 with a so called “bridging” ontology. The HBES-IFC mapping, respectively the bridging is available as  
 109 electronic turtle file under <https://schema.knxiot.org/ontology/owl-mapping/knx-ifc-mapping>.

110 The current HBES Information Model does not consider other aspects of a HBES installation such as  
 111 for instance topology or device models.

## 112 5 Location Model

### 113 5.1 Introduction

114 The Location model wishes to address the following requirements.

- 115 — Bridging to BIM

116 Many concepts of the Location model match concepts provided by the Industry Foundation Class  
 117 Ontology (ifcowl) that has been created to work with BIM models. In particular, *Building*, *Floor* and  
 118 *Space* map to *IfcBuilding*, *IfcBuildingStorey* and *IfcSpace* and thus make bridging to a BIM model  
 119 quite easy.

- 120 — Alternate hierarchies

121 The common superclass *Location* of HBES IoT Information Model allows specifying an alternate  
 122 location hierarchy or not strictly sticking to the usual hierarchy, should someone - for some reason –  
 123 want to do so.

124 EXAMPLE 1 A HBES IoT Information Model element *Room* can be associated directly with a Building (rather  
 125 than with a Floor, as usual) semantically strongly expressed via object property “hasRoom” or semantically  
 126 weakly expressed via the object property “hasSubLocation”, without violating any constraints specified by the  
 127 Location model.

128 — Extensibility

129 The concept *Space* represents a generic location inside a building. Therefore, it can also be used to  
 130 define types of Locations that do not fit directly into the fabric of the existing Location model classes.  
 131 This can either be achieved by defining (in an extension of the current HBES Information Model)  
 132 additional properties or by defining new subclasses of *Space* that are better suited for the respective  
 133 purpose.

134 EXAMPLE 2 If it is wanted to model a wing as a part of a building, then a class *Wing* with specific wing  
 135 properties may be added.

## 136 5.2 Classes and Relations

### 137 5.2.1 Introduction

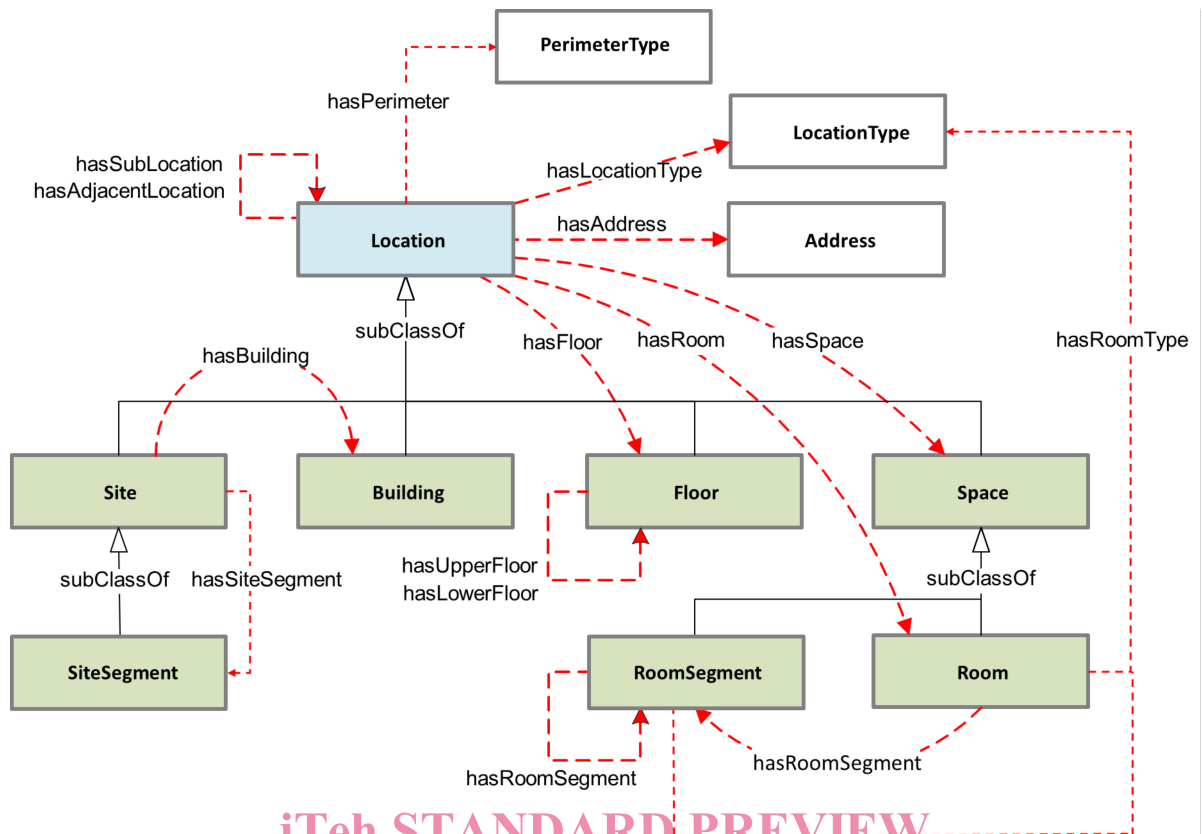

138 This section contains a formalized description of the location model as shown in the Figure 3 below.

139 — The blue box denotes the topmost generic *Location*, from which all subclasses are derived.

140 — Green boxes denote HBES Information Model concepts that are mapped to IFC concepts with  
 141 the HBES- IFC mapping ontology.

142 — White boxes with annotation “subClassOf” define specific (child) Location classes, white boxes  
 143 without this annotation describe concepts, independent from the concept Location.

144 — Red dotted lines and their direction describe relationships between classes.

iTeh STANDARD PREVIEW

(standards.itel.ai)  
 Figure 3 — Location Model

145

146

147 Ontology classes or their relationships have many properties. Only the main ontology classes and  
 148 their main properties are described here.

149 Not all relationship properties (such as being “functional”), their property domain/  
 150 available inverse properties to this relationship are enumerated in the below lists. Also, if a class  
 151 supports an explicit name and/or description is not mentioned hereunder.

152 For these details, please refer to the HBES IoT Information Model under  
 153 <https://schema.knxiot.org/ontology/full>.

## 154 5.2.2 Classes

155

Table 1 — Classes of the Location Model

Class	Definition
Location	<p><b>Description</b></p> <p>A <i>Location</i> is a physical named geographical place (such as “Lake side meeting room”, “Oskar’s office”, “The 5th floor”, “Mountain view dwelling” etc.) that is used to identify a point, an area or room, inside or outside of a <i>Building</i>.</p> <p><b>Main Properties</b></p> <ul style="list-style-type: none"> <li>— <i>hasSubLocation</i></li> <li>— <i>hasAdjacentLocation</i></li> <li>— <i>hasLocationType</i></li> <li>— <i>hasAddress</i></li> <li>— <i>hasPerimeter</i></li> <li>— <i>hasFunction</i></li> <li>— <i>hasDevice</i></li> </ul> <p><b>Sub Class of</b></p> <p>-</p> <p><b>Disjoint With</b></p> <ul style="list-style-type: none"> <li>— all root classes of HBES IoT Model</li> </ul> <p><b>Notes</b></p> <p>The class <i>Location</i> can be used as a bridging class to other ontologies (e.g. to the Point model, see Clause 1.5).</p> <p><a href="https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-4c4916487403/osist-pren-50090-6-2-2020">https://standards.iteh.ai/catalog/standards/sist/cbc94828-a0f0-4f4e-aae4-4c4916487403/osist-pren-50090-6-2-2020</a></p>
Site	<p><b>Description</b></p> <p>A <i>Site</i> represents a collection of <i>Buildings</i> and grounds that belong to a given institution.</p> <p><b>Main Properties</b></p> <ul style="list-style-type: none"> <li>— <i>hasBuilding</i></li> <li>— <i>hasSiteSegment</i></li> </ul> <p><b>Sub Class of</b></p> <p><i>Location</i></p> <p><b>Disjoint With</b></p> <ul style="list-style-type: none"> <li>— Building, Floor, Space</li> </ul> <p><b>Notes</b></p> <p>The concept <i>Site</i> can be mapped to an IFC Site.</p>

Class	Definition
SiteSegment	<p><b>Description</b> A <i>SiteSegment</i> is a part of a ground, land or of a campus. It subdivides a <i>Site</i>.</p> <p><b>Main Properties</b> -</p> <p><b>Sub Class of</b> <i>Site</i></p> <p><b>Disjoint With</b> -</p> <p><b>Notes</b> The concept <i>SiteSegment</i> can be mapped to an IFC <i>Site</i>.</p>
Building	<p><b>Description</b> A <i>Building</i> represents a whole building. A real-world building hosts several other real-world elements such as stacked floors or spaces or rooms, in ontology terms this would a <i>Room</i>, <i>Floor</i>, <i>Space</i>, <i>RoomSegment</i>.</p> <p><b>Main Properties</b></p> <ul style="list-style-type: none"> <li>— <i>hasFloor</i></li> <li>— <i>hasRoom</i></li> <li>— <i>hasRoomSegment</i></li> <li>— <i>hasSpace</i></li> </ul> <p><b>Sub Class of</b> <i>Location</i></p> <p><b>Disjoint With</b> — <i>Site</i>, <i>Floor</i>, <i>Space</i></p> <p><b>Notes</b> For a <i>Building</i>, it might also make sense to specify a <i>LocationType</i> and/or an <i>Address</i>. The concept <i>Building</i> can be mapped to the IFC concept <i>IfcBuilding</i>.</p>
