English Version

Protective clothing - Garments with permethrin as-treated articles supporting the protection against tick bites

Habillement de protection - Vêtements de protection traités à la perméthrine favorisant la protection contre les piqûres de tiques

Schutzkleidung - Mit Permethrin behandelte Schutzkleidungsstücke zum Schutz gegen Zeckenbisse

This European Standard was approved by CEN on 4 November 2024.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

European foreword

This document (EN 17487:2024) has been prepared by Technical Committee CEN/TC 162 “Protective clothing including hand and arm protection and lifejackets”, the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2025, and conflicting national standards shall be withdrawn at the latest by June 2025.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document has been prepared under a standardization request addressed to CEN by the European Commission. The Standing Committee of the EFTA States subsequently approves these requests for its Member States.

For the relationship with EU Legislation, see informative Annex ZA, which is an integral part of this document.

Any feedback and questions on this document should be directed to the users’ national standards body. A complete listing of these bodies can be found on the CEN website.

According to the CEN-CENELEC Internal Regulations, the national standards organisations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and the United Kingdom.

EN 17487:2024 (E)

Introduction

By preventing tick bites, a range of tick-borne infectious diseases can be prevented. This document refers to protection against all biting stages of the tick *Ixodes ricinus*, hereafter named wood tick, the tick species with the largest occupational and public health relevance in Europe.

The most prevalent disease transmitted by the wood tick is Lyme borreliosis, but (until now incidentally) also other diseases like tick-borne encephalitis. Lyme borreliosis can affect the skin, nervous system, joints and heart. In some EU countries, Lyme borreliosis is regarded as an occupational disease. Employers are then obliged to make the best possible effort to prevent occupational diseases among employees. Employees are also obliged to reasonably abide by the measures offered.

The garments help protect people who can come into contact with ticks during their work. Wood ticks lay in ambush in the lower vegetation and cling on to passers-by with whom they come in to contact. They then crawl over skin or garment to find a site where they can consume a blood meal. The protective effect of the garment against tick bites is primarily determined by the extent to which the garment covers the skin, and this effect will increase as a larger part of the body is covered. It is important here that those body parts (legs, waist, torso and arms) are covered that have contact with vegetation in which ticks can be present (up to a height of 1,5 m). When wearing covering garments without permethrin, ticks are able to crawl over the fabric for minutes up to several hours and reach bare skin to bite. In addition to the protective effect of covering the body, the permethrin on or in the fabric offers extra protection. Ticks that come in contact with permethrin are immobilized, and as a result they are no longer able to reach bare skin and transfer pathogens through a bite. Protection against tick bites can be one of the functions of a garment. Examples of other functions can be maintaining body heat, preventing exposure to UV light, camouflage, preventing skin irritation or injury by plants or working conditions, or representation and recognizability.

The body covering garments can also help other target groups such as volunteers and recreationists (such as hunters) to offer protection against tick bites. However, the choice of using the garments is ideally based on a professional risk assessment which includes exposure to ticks, and factors such as age and pregnancy. Instructions for use and warnings for tick bite risks also apply to these users and it is important that these are provided to these groups by the manufacturers of these garments.

The body covering garment industrially treated with permethrin or made with fabrics based on yarn containing permethrin yarns, or other treated fabrics, can also help to protect against other arthropods that can transmit diseases, such as different tick and mosquito species [6]. However, this document only applies to the protection against bites by the wood tick, and specifically the most relevant developmental stage (nymphs). A detailed description of the requirements is given in Clause 4 of this document.

Garments can be treated with permethrin to prevent tick bites. In accordance with the Biocidal Products Regulation (EU) 528/2012, such garments can be regarded either as 'treated articles' (if protection against ticks is part of a set of functionalities such as protection against weather conditions, camouflage, company representation, protection against stinging plants, etc.) or as 'biocides' (if the primary function of the garment is protection against tick bites). This document is only focusing on garments to be considered as treated articles [3].

The release rate of permethrin from the garment should be as minimal as possible in order protect the environment and the human health, and is for example dependent on the way the permethrin has been fixated on- or inside the fabric. The World Health Organization (WHO) states limits to the daily uptake of permethrin by the human body. This document states requirements to ensure that these limits will not be exceeded by wearing the protective garments and to safeguard that the additional protective effect of the permethrin is maintained throughout the lifetime of the garment. Additional general information can be found in Annex C. The importance of the manufacturers cleaning instructions to prevent early deterioration of the effect of permethrin treatment is stressed throughout the document.

National requirements can be in place in different countries for the maximum permethrin concentration in consumer products. Collection of relevant data can be helpful for a further assessment for conformity of garments based on this document to those national requirements.

<https://standards.iteh.ai/catalog/standards/sist/a717c615-ad9d-4367-b850-f68981bf3666/sist-en-17487-2025>

EN 17487:2024 (E)

1 Scope

This document specifies requirements for garments that support the protection against tick bites. The document applies to body covering garments (at least covering the torso, arms and legs) where protection against tick bites, which is provided by garments as physical barriers, is reinforced by industrial treatment with the biocide permethrin of the fabrics, fibres or yarns prior to confection. The specified requirements focus on prevention of bites by the nymph stage of the tick *Ixodes ricinus*, which is the most relevant stage and species for public and occupational health in Europe.

This document specifies requirements and the tests for garments containing permethrin to provide sufficient assistance in protection against tick bites, and to be durable and safe for the user.

This document does not apply to garments which are re-treated with permethrin or other substances after they are put on the market.

NOTE Non-permethrin containing garments covering the torso, arms and legs and feet offer some protection against tick bites, but are insufficient under high exposure to ticks, which can crawl over the fabric to reach bare skin and bite. Garments that comply with this document and cover at least torso, arms and legs to counter ticks from crawling over the fabric to reach bare skin and bite thereby provide substantial protection.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <https://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

3.1

accepted daily intake

ADI

maximal allowed daily body intake of a substance (100 %) before adverse health effects can be expected

Note 1 to entry: In this document, the substance is permethrin.

Note 2 to entry: Based on the definition of the World Health Organization (WHO).

3.2

permethrin bio-activity

degree to which permethrin in the test fabric affects the test animals that came into contact with the fabric in the test assay

Note 1 to entry: This value is determined by the degree to which the animal comes into contact with permethrin.

Note 2 to entry: Bio-activity is not by definition determined by the permethrin concentration in a fabric. It is determined by the availability of permethrin present at contact surfaces of the fabric.

3.3

biocidal product

— any substance or mixture which, in the form in which it is supplied to the user, consists of, contains or generates one or more active substances, with the purpose of destroying, deterring, rendering harmless, preventing the action of, or otherwise exerting a controlling effect on a harmful organism by any means other than mere physical or mechanical action

— any substance or mixture, generated from substances or mixtures which do not themselves fall under the first indent, to be used with the intention of destroying, deterring, rendering harmless, preventing the action of, or otherwise exerting a controlling effect on, any harmful organism by any means other than mere physical or mechanical action

Note 1 to entry: The garments considered in this document are treated articles. A treated article that has a primary biocidal function shall be considered a biocidal product. According to the definitions set by the EU, products treated with permethrin can be considered as biocidal products or treated articles. This consideration could differ per product and depends on the primary function of the product. If the product is primarily intended to control harmful organisms or to prevent harmful effects, then the product is considered a biocide. If the biocidal effect through treatment with permethrin is only an additional property to the basic function(s) of the product, such product / object can be regarded as treated article [2].

[SOURCE: 528/2012 EU regarding biocidal products regulation, 2018-06-15]

3.4

cytotoxicity

effect of one or more components in a substance on growth of living cells in a cell culture
