## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#).

The committee responsible for this document is ISO/TC 20, *Aircraft and space vehicles*, Subcommittee SC 14, *Space systems and operations*.

## Introduction

This Technical Report will provide a recommendatory method for post-launch assessment of the orbit elements precision at separation, which is conducive to improving international communication effect and reducing the risks from errors resulting from miscommunication. It can estimate the orbit elements precision at separation, provide the reference for fuel capacity design of launch vehicle and spacecraft, and then help to reduce the manufactory costs of rocket and payload.

# Space systems — Best practices for orbit elements at payload — LV separation

## 1 Scope

This Technical Report provides the best practices for orbit elements at payload-LV separation. It includes orbit elements and calculation conditions, calculation method of orbit elements and their errors at elliptical orbit insertion of various payloads. The fit between the actual and expected values of orbit elements can be used as a criterion of commercial launch.

There are many different sets of orbit elements. Each is best suited for a particular application. The traditionally used set of orbital elements is called the set of Keplerian elements. This Technical Report gives the calculation method of Keplerian elements and the transformation method of all the other orbit elements, in order to satisfy different user's need.

Affected by terrestrial gravitational perturbation, lunisolar gravitation perturbation and other factors, orbit elements change slowly after orbit injection. Orbit elements calculation methods after separation are not included in this Technical Report.

The technical communication and specific progress for orbit elements is relatively easy to be agreed on by applying this Technical Report, which can contribute to avoiding possible disputes.

## 2 Symbols and abbreviated terms

### 2.1 Abbreviated terms

BIPM	Bureau International des Poids et Mesures
CTP	Conventional Terrestrial Pole
GAST	Greenwich Apparent Sidereal Time
GMST	Greenwich Mean Sidereal Time
GCRF	Geocentric Celestial Reference Frame
GPS	Global Positioning System
IERS	International Earth Rotation and Reference System Service
IRM	International Reference Meridian
ITRF	International Terrestrial Reference Frame
ITRS	International Terrestrial Reference System
LGEIF	Launch Geocentric Equatorial Inertial Frame
LV	Launch Vehicle
PZ90	Acronym of Russian Parametry Zemli 1990
SI	International System of Units

TAI	International Atomic Time
TCG	Geocentric Coordinate Time
TDT	Terrestrial Dynamical Time
THF	Topocentric Horizon Frame
UT1	Universal Time
UTC	Coordinated Universal Time
WGS84	World Geodetic System, 1984

## 2.2 Symbols

$a$	semimajor axis
$a_e$	earth semimajor axis of terrestrial ellipsoid IERS used in ITRS
$b$	semiminor axis
$E$	eccentric anomaly
$e$	eccentricity
$GM_e$	earth gravitational parameter used in ITRS
$h_a$	apogee altitude
$h_p$	perigee altitude
$i$	inclination
$M$	mean anomaly
$n$	mean motion of satellite
$p$	semilatus rectum
$r_a$	apogee radius
$r_p$	perigee radius
$S_0$	GAST at the time of payload – LV separation
$T$	period
$t_p$	time interval between the launch moment and the perigee passing
$t_{SEP}$	time interval between the launch moment and the payload – LV separation
$u$	argument of latitude
$V$	velocity
$V_x, V_y, V_z$	projection of velocity in LGEIF
$x, y, z$	projection of position in LGEIF
$\alpha_e$	flattening of the earth

iTeh STANDARD PREVIEW  
(standards.iteh.ai)

ISO/TR 19473:2015  
<https://standards.iteh.ai/catalog/standards/sist/37245df1-16bf-4542-94f8-68af3af1d405/iso-tr-19473-2015>

$\theta$	true anomaly
$\varphi_{e0}$	geocentric latitude at launch point
$\lambda_0$	longitude at launch point
$\lambda_N$	longitude of the ascending node in LGEIF
$\omega$	argument of perigee
$\omega_e$	angular velocity of the earth
$\Omega$	right ascension of the ascending node

### 3 Orbit elements and calculation conditions

#### 3.1 Orbit elements

Six independent orbit elements describe the orbit of a satellite. Two elements describe orbit size and shape, three elements describe orbit orientation, and one element describes orbit location.

Orbit size and shape parameters include the following:

- a) semimajor axis;
- b) eccentricity;
- c) semiminor axis;
- d) semilatus rectum;
- e) perigee radius;
- f) apogee radius;
- g) perigee altitude;
- h) apogee altitude;
- i) period;
- j) mean motion.

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

[ISO/TR 19473:2015](https://standards.iteh.ai/catalog/standards/sist/37245df1-16bf-4542-94f8-68af3af1d405/iso-tr-19473-2015)

<https://standards.iteh.ai/catalog/standards/sist/37245df1-16bf-4542-94f8-68af3af1d405/iso-tr-19473-2015>

Orbit orientation parameters include the following:

- a) inclination;
- b) right ascension of the ascending node;
- c) argument of perigee;
- d) longitude of the ascending node.

Satellite location parameters include the following:

- a) true anomaly;
- b) eccentric anomaly;
- c) mean anomaly;
- d) time past perigee;

- e) time past ascending node;
- f) argument of latitude.

The orbit elements are shown in [Figure 1](#).

<https://standards.iteh.ai/catalog/standards/sist/37245df1-16bf-4542-94f8-68af3af1d405/iso-tr-19473-2015>  
**Figure 1 — Orbit elements**

The orbit ellipse geometry is shown in [Figure 2](#).

**Figure 2 — Ellipse geometry**

## 3.2 Data source

### 3.2.1 General

Calculation of orbit elements at separation uses velocity vector and position vector. Ground-based or space-based external measurements should be used.

### 3.2.2 Guideline of correction about the external measurements

#### a) Correction about lift-off time

Unified timer start point about different instruments is suggested to be specified. The timer start point needs to be corrected by lift-off time.

#### b) Correction about tracking point

Tracking point of different measurement instruments at flight region is suggested to be provided. The tracking point is usually transformed into LV navigation system coordinate frame. The data of tracking point correction is usually provided by system engineering department.

#### c) Correction about exception value

The measurement data need to pass a reasonable test and exception value needs to be deleted if necessary.

#### d) Correction about measurement data

The measurement data correction includes radio measurement and optical measurement. The measurement data based on ship is suggested to include ship drift position correction, ship deformation correction, and ship attitude correction.

#### e) Data format

<https://standards.iteh.ai/catalog/standards/sist/37245df1-16bf-4542-94f8-68af3af1d405/iso-tr-19473-2015>

Data format is based on decade float point and the bit numbers are determined by measurement accuracy and measurement mission.

### 3.2.3 External measurement data accuracy

#### a) Considering the need for flight test.

#### b) Considering the need for flight test result and injection accuracy.

#### c) Considering the need for external measurement accuracy.

#### d) Considering the accuracy, economy, and configuration about external measurement instrument in the flight region.

## 3.3 Coordinate systems and time systems

### 3.3.1 Coordinate systems

#### a) True Greenwich Frame

- The origin is located at the Earth's centre of mass (including oceans and atmosphere).
- The Z axis coincides with the instantaneous earth's axis of rotation and points northward.
- The x-axis is directed vertical to the Z axis and make X-Z plane coinciding with the plane of the true Greenwich meridian.
- The y-axis completes a right-handed system.
