Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™** and **LTE™** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This Technical Specification (TS) has been produced by ETSI Special Committee Emergency Communications (EMTEL).

Modal verbs terminology

In the present document **"shall"**, **"shall not"**, **"should"**, **"should not"**, **"may"**, **"need not"**, **"will"**, **"will not"**, **"can"** and **"cannot"** are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"must" and **"must not"** are **NOT** allowed in ETSI deliverables except when used in direct citation.

Executive summary

The Pan-European Mobile Emergency Application (PEMEA) architecture provides a framework to enable applications supporting emergency calling functionality to contact emergency services while roaming. PEMEA caters for a range of extension capabilities, including Audio_Video which provides an audio and/or video real-time communication capability between the App user and the PSAP. The present document provides a specification for an Audio_Video capability for PEMEA.

Introduction

Audio-video communications are a common communications capability in all modern communication Apps. These Apps support dedicated and multi-party video communications on a range of platforms including mobile phones, tablets, laptops and browsers. While some applications use SIP to establish communications sessions, the vast majority use WebRTC media streams, generally with proprietary signalling.

Using simple WebRTC Audio_Video communications enables equal access to emergency services for both abled and disabled citizens from almost any device, safely and easily while keeping with the modern trend towards all Web-based communications.

The specification in the present document does not preclude PEMEA from being used to support and initiate other protocols or implementations.

The present document assumes a working knowledge of PEMEA and familiarity with the PEMEA specification ETSI TS 103 478 [1]. Terms common to the PEMEA specification are not redefined or explained in detail in the present document.

<https://standards.iteh.ai/catalog/standards/sist/b96736e1-c47b-4220-a977-9c658d46201e/etsi-ts-103-945-v1-1-1-2023-11>

1 Scope

The present document describes the PEMEA Audio_Video (PAV) capability, and the need for this functionality. The required entities and actors are identified along with the protocol, specifying message exchanges between entities. The message formats are specified and procedural descriptions of expected behaviours under different conditions are detailed.

3 Definition of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the following terms apply:

security: techniques and methods used to ensure:

- **authentication** of entities accessing resources or data.
- **authorization** of authenticated entities prior to accessing or obtaining resources and/or data.
- **privacy** of user data ensuring access only to authenticated and authorized entities.
- **secrecy** of information transferred between two authenticated and authorized entities.
- **trusted:** is used as defined in ETSI TS 103 478 [1].

3.2 Symbols

Void.

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

AEAD	Authenticated Encryption with Associated Data
AES	Advanced Encryption Standard
AESGCM	Advanced Encryption Standard key used with GCM
AP	Application Provider

App	Application
CN	Comfort Noise
CPE	Customer Premises Equipment
DHE	Diffie-Hellman key Exchange
ECDHE	Elliptic-Curve Diffie-Hellman key Exchange
ECDSA	Elliptic Curve Digital Signature Algorithm
EDS	Emergency Data Send (message)
ETSI	European Telecommunications Standards Institute
FID	Flow Identification
GCM	Galois/Counter Mode
HTTP	Hyper-Text Transfer Protocol
HTTPS	Secure HTTP
ICE	Interactive Connectivity Establishment
IETF	Internet Engineering Task Force
IM	Instant Messenger
IP	Internet Protocol
JSON	JavaScript Object Notation
JWT	JSON Web Token
MAC	Message Authentication Code
NAT	Network Address Translation
Pa	PEMEA Application to AP interface
PAV	PEMEA Audio_Video
PCMA	Pulse Code Modulation A-Law
PCMU	Pulse Code Modulation μ -Law
PEMEA	Pan-European Mobile Emergency Application
PIM	PSAP Interface Module
PSAP	Public Safety Answering Point
PSP	PSAP Service Provider
RFC	Request For Comments
RSA	Rivest Shamir Adleman public key encryption algorithm
RTC	Real-Time Communications
RTP	Real-Time Protocol
RTT	Real-Time Text
SDP	Session Description Protocol
SFU	Selective Forwarding Units
SIP	Session Initiation Protocol
STUN	Session Traversal Utilities for NAT
TLS	Transport Layer Security
tPSP	terminating PSP
TS	Technical Specification
TURN	Traversal Using Relay around NAT
UCS	Universal multiple-octet Coded Character Set
UDP	User Datagram Protocol
URI	Uniform Resource Identifier
UTC	Coordinated Universal Timer
UTF-8	UCS Transformation Format (8-bit words)
WMS	WebRTC MediaStream

4 PEMEA capability extensions

4.1 Overview of extension in PEMEA

PEMEA extension capabilities are defined in ETSI TS 103 478 [1] and are implemented through the use of "reach-back" URIs. The Application Provider (AP) node advertises capabilities as part of the initial forward message through the network, the Emergency Data Send (EDS) message, and the terminating PSAP Service Provider (PSP) or PSAP responds with the subset of capabilities that it supports, thus binding the emergency session between the AP and the terminating emergency node.

Specifically, the capabilities are sent as information elements in the apMoreInformation element of the EDS message. The information element and apMoreInformation structures are defined in clauses 10.3.11 and 10.3.12 of ETSI TS 103 478 [1]. An information element in a PEMEA EDS message identifies a capability and each capability is made up of three distinct parts:

- typeOfInfo: what function does the information element serve;
- protocol: the specific semantics for using the function;
- value: the URI through which the service is invoked.

Table 10 in ETSI TS 103 478 [1] identifies an initial set of "typeOfInfo" values used to specify a range of capability extensions for PEMEA. However, beyond the Location_Update and SIP_Request values described in Table 11 of ETSI TS 103 478 [1], protocols are left for further study and definition in subsequent specifications such as the present document. ETSI TS 103 756 [i.1] describes the concrete specification for PEMEA Instant Message protocol and ETSI TS 103 871 [i.2] describes the concrete specification for PEMEA Real-Time Text.

4.2 Service support indication and response

4.2.1 Service definition

ETSI TS 103 478 [1] defines the "Audio_Video" typeOfInfo in Table 10, but does not elaborate further on protocols in Table 11. The present document provides a concrete definition of the "Audio_Video" typeOfInfo in PEMEA through the specification of a protocol value. The definition in Table 1 shall be considered as an extension to Table 11 in ETSI TS 103 478 [1].

Table 1: Extended AP Information Type Protocol Registry

Info type Value	Protocol Token	Description
Audio_Video	PEMEA	Audio_Video functionality is supported using the PEMEA WebRTC message exchange protocol

4.2.2 Service support indication

An AP needing to indicate that the Application it is serving can support real-time text using the PEMEA protocol would include the following information element in the apMoreInformation element of the EDS associated with the emergency session:

```
<information typeOfInfo="Audio_Video" protocol="PEMEA">
  https://ap.example.pemea.help/37agq1cyusbo
</information>
```

4.2.3 Service support response

A terminating node that can support the "Audio_Video" "PEMEA" capability includes this capability in the apMoreInformation element returned to the AP in the onCapSupportPost. This is described in clause 11.1.4 of ETSI TS 103 478 [1] with the value for "Audio_Video" "PEMEA" provided in the example below.

```
<apMoreInformation xmlns="urn:pemea:apps:xml:ns:pemea:base">
  <information typeOfInfo="Audio_Video" protocol="PEMEA"/>
</apMoreInformation>
```

4.2.4 Auto response service

The original intent of many emergency applications was to provide ancillary data to the PSAP that was associated with an emergency voice call that the PSAP had, or soon would, receive. As a consequence, a PIM or tPSP usually notifies the PSAP-CPE when an EDS has arrived, but does not respond to the AP until a PSAP Call-Taker has answered the call. Operating in this manner allows for smart routing solutions ensuring that only the PSAP with the call binds the PEMEA session to the AP, ensuring that the data is always available to the PSAP Call-Taker rather than it being missing because it went to the wrong PSAP.

ETSI TS 103 478 [1] identifies some types of capabilities, most notably the SIP_Request capabilities, as being responded to automatically, that is, the PIM or tPSP sends an immediate onCapSupportPost message with all supported capabilities if the EDS contains a SIP_Request capability. This functionality is described in clause 8 of ETSI TS 103 478 [1] and came about because there was no way for the App to make a voice call until it has a destination SIP URI, so there was no possible way for the data to not be available at the destination PSAP.

Another reason for auto-response is that no conventional carrier/mobile voice call will be placed as part of the emergency communication. That is, only PEMEA advanced services will be used for communicating between the Caller and the PSAP Call-Taker.

The (PAV) capability falls into this latter category of services, that is, it is used in place of a conventional carrier/mobile voice call. Consequently, a PSAP (PIM or tPSP) supporting this capability and with the capacity to handle the communication shall respond to the AP with an onCapSupportPost message immediately on receipt of an EDS containing a PAV capability. The onCapSupportPost message shall contain the PAV capability along with any other capabilities that the PSAP supports.

If the PSAP does not support the PAV capability but does support another form of proffered multi-media communication, such as IM or RTT, then the PSAP should respond with only those capabilities.

5 Architecture

5.1 Overview

The PEMEA Audio_Video (PAV) capability is WebRTC-based, so it is necessary to understand a little bit about WebRTC in order to understand what is signalled, to whom and between which entities. This also helps to understand explicitly what is normatively specified in the present document, what is semantic, and what is normatively referred to from the present document but normatively specified in other documents.

The PAV capability was realized with disability usage in mind and the usage model for this necessitates multi-party communications where the Caller and PSAP Call-Taker represent two parties, but a third-party sign-language interpreter is also, more than likely, expected to participate in the call.

5.2 Architecture and high-level WebRTC flows

WebRTC was designed to use peer-to-peer communications between web browsers, and this means that media stream connections are between peers. In an Audio_Video flow, each participant can have 2 streams to send, one audio stream from a microphone and one video stream from a camera. It is not mandatory to have always both streams, and a participant could only negotiate its audio stream and not initially negotiate its video stream.

PEMEA is structured around the AP being the gateway between the App and the PSAP. This model requires communications to occur, first between the App and the AP over the proprietary Pa interface and then between the AP and the associated PSAP service using the protocol mechanisms defined in the specific extension capability document. For most services, this approach is fine, however, for latency and delay intolerant services this approach may need to be relaxed somewhat to ensure that the capability delivers the required functionality. Such a case occurs with media streams that are providing a conversation, the streams should be as direct as possible, so this is the approach allowed for the PAV capability. Signalling for the session goes via the AP and to the PAV Service in the PSAP, while the media streams may go directly between the Caller and the PAV or via the AP if security measure require it. This shown in Figure 1.

Media streams, where possible, should be as direct as possible between the communicating parties, however, owing to a range of networking impediments, communications often do not happen in this fashion and so it is necessary to use a TURN Server in the media path to ensure connectivity. The role of the TURN Server is to provide a common contact point between different communication parties through which the media streams can flow. In practical terms, in PSAP deployments firewalls exist between the Call-Taker equipment and any incoming media streams, so a TURN Server is always required. Consequently, a TURN Server is included as a mandatory component of the PAV architecture. The TURN server specification is defined in IETF RFC 5766 [16].

In the core WebRTC specifications a media server may be used to aggregate streams reducing the number of required peer connections, to allow transcoding between the participants, or to control the flow of the streams during the conversation. However, demultiplexing multiple streams on single connection increases complexity which is undesirable and unwarranted in emergency calling-applications where the number of participants in the communication is small. Consequently, PAV requires stream sets to be negotiated independently between participants using an architectural approach referred to as Selective Forwarding Units (SFU). Development of PEMEA Apps has been centred around equivalent access to emergency services, and so allowing control over how to display the videos of different participants is crucial to improve the accessibility and usability of these Apps.

Figure 1 depicts the PAV service architecture. It includes not only a TURN Server to allow NAT traversal, but also a Media Server to allow the control of the media streams as described in clause 15. It can also be used to record conversations for audit purposes.

Figure 1: Audio_Video architecture for PEMEA

- Pa interface, the application makes a call to the AP indicating the PAV capability. Invocation information is returned to the App over this interface too.
- The AP packages the information from the App into an EDS message and sends it into the PEMEA network via the Ps interface. The EDS arrives at the PIM over the Pp interface. The PIM sends an onCapSupportPost message to the AP binding the connection between the AP and the PIM.
- The PIM notifies the PSAP-CPE which in turn notifies the PSAP Call-Taker. The call is answered and controlled by the PSAP Call-Taker over this interface also. This includes requesting the creation of a PAV session. The PSAP Call-Taker is also able to request connection credentials for additional participants over this interface.
- On direction from the PSAP Call-Taker (or automatically as described in clause 4.2.4) the PIM creates a new PAV signalling instance and requests Bearer tokens from the Security Token Management system. It shall generate at least a token for the PSAP Call-Taker and a token for the Caller.
