Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 45, *Rubber and rubber products*, Subcommittee SC 4, *Products (other than hoses)*.

This third edition cancels and replaces the second edition (ISO 6123-2:1988), of which it constitutes a minor revision to update the normative references.

ISO 6123 consists of the following parts, under the general title *Rubber or plastics covered rollers — Specifications*:

- *Part 1: Requirements for hardness*
- *Part 2: Surface characteristics*
- *Part 3: Dimensional tolerances*

Introduction

Covered rollers are cylindrical cores, generally of metal, with a cover of rubber or plastics or a particular use. They are manufactured in a wide variety of sizes and hardness grades depending on the intended use.

Rubber or plastics covered rollers — Specifications —

Part 2: Surface characteristics

1 Scope

This part of ISO 6123 establishes a classification of rubber or plastics covered rollers according to surface quality or imperfections and surface finish. A test method for the determination of surface roughness is also described.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 3274, *Geometrical Product Specifications (GPS) — Surface texture: Profile method — Nominal characteristics of contact (stylus) instruments*

ISO 4288, *Geometrical Product Specifications (GPS) — Surface texture: Profile method — Rules and procedures for the assessment of surface texture*

ISO 23529, *Rubber — General procedures for preparing and conditioning test pieces for physical test methods*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1 arithmetical mean deviation of the profile

R_a

arithmetical mean of the absolute values of the profile departures within the sampling length, l

$$R_a = \frac{1}{l} \int_0^l |y(x)| dx \text{ or approximately } R_a \approx \frac{1}{n} \sum_{i=1}^n |y_i|$$

where n is the number of discrete profile deviations.

Note 1 to entry: The values of R_a in practice are determined within the evaluation length which includes several sampling lengths. According to ISO 3274, the sampling length is equal to the cut-off.

3.2 ten point height of irregularities

R_z

average value of the absolute values of the heights of five highest profile peaks and the depths of five deepest profile valleys within the sampling length

$$R_z = \frac{\sum_{i=1}^5 |y_{pi}| + \sum_{i=1}^5 |y_{vi}|}{5}$$

where

y_{pi} is the height of the i th highest peak profile;

y_{vi} is the depth of the i th deepest profile valley.

Note 1 to entry: Depending on the shape of the profile, in certain cases, a problem arises associated with the lack of a number of profile peaks and valleys and/or the super-imposing of waviness on the roughness.

4 Surface quality

4.1 General

The manufacturing process and the raw materials used in the manufacture of rubber or plastics covered rollers may cause sporadic imperfections, in the form of holes and foreign matter, in the surface of the roller covers. The number, size and location of permissible surface imperfections shall be agreed between the interested parties.

The type of surface finish (see [Clause 5](#)) shall be observed when selecting the grade of imperfections.

4.2 Grades

The rollers may be graded according to the permissible numbers and sizes of imperfections as follows:

Grade x/y

iTeh STANDARD PREVIEW
(standards.iteh.ai)

This means that

- imperfections up to and including x mm² in area are acceptable;
- not more than two imperfections each having an area between x mm² and y mm² inclusive are permissible in any 0,1 m² of cover area;
- roller covers showing imperfections larger than y mm² in area shall be rejected.

The values of x and y shall be agreed between the interested parties.

If no requirements for surface quality are necessary, the rollers shall be designated “grade N”.

EXAMPLE A medium grade of surface quality can be described by the designation:

Grade 0,5/2

This means that

- imperfections up to and including 0,5 mm² in area are acceptable;
- not more than two imperfections each having an area between 0,5 mm² and 2 mm² inclusive are permissible in any 0,1 m² of cover area;
- roller covers showing imperfections larger than 2 mm² in area shall be rejected.

If agreement between the interested parties, or special provisions in national standard, are intended, the required quality should be chosen from the grades given below:

- grade 0,1/0,3
- grade 0,3/1
- grade 0,5/2
- grade 2/5

- grade 5/10
- grade N

5 Surface finish

The surface finish of a roller cover is dictated by the intended use. It shall be characterized either as a type of surface treatment (see 5.1) or as the maximum value of surface roughness (see 5.3), as agreed between the interested parties.

5.1 Methods of surface treatment — Terms and classification

Table 1 shows the generally employed principal methods of surface treatment, by means of which the roller surfaces are classified (see 5.2). The type of surface finish, and the structure or texture which can be achieved, are dependent upon the hardness and composition of the roller cover.

Table 1 — Surface finishes

Type	Surface treatment	Sequence of treatment
1	Polishing	↑
2	Grinding, fine	↑
3	Grinding, standard	↑
4	Turning	↑
5	Unground finish	↑

5.2 Description by surface treatment — Types

The surface structures described for Types 1 to 4 are produced by regular treatments and have a roughness without preferential direction.

The type required shall be chosen by agreement between the interested parties.

5.2.1 Type 1 — Polished finish

In soft elastomers, the surface is velvet-like; in hard rubber (ebonite) or plastics, it is smooth.

Grinding marks and scratches shall not be visible to the naked eye. Sporadic grinding blemishes are permissible. Not all qualities permit this finish.

5.2.2 Type 2 — Fine grinding finish

Slight grinding and feed marks are visible to the naked eye, but are not noticeable when touching the roller.

5.2.3 Type 3 — Standard grinding finish

Grinding marks and grinding feed are visible and just noticeable when touching the roller.

5.2.4 Type 4 — Turned finish

The surface is solely turned, with as little feed of the turning tool as practicable. Turning grooves are visible and noticeable when touching the roller.
