Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 31, *Automatic identification and data capture techniques*.

This fourth edition cancels and replaces the third edition (ISO/IEC 18000-4:2015), which has been technically revised. The main changes compared to the previous edition are as follows:

— Mode 4, described in [Clause 9](#) as "MODE 4: Configurable data rate active RFID system", has been added.

A list of all parts in the ISO 18000 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

This document is one of a series of International Standards and Technical Reports developed by ISO/IEC JTC 1/SC 31 for the identification of items (item management) using radio frequency identification (RFID) technology.

This document defines four 2,45 GHz protocols. Each of the specific physical/data link configuration is defined in a separate subclause. The configuration descriptions include a physical layer and a data link layer.

The International Organization for Standardization (ISO) and International Electrotechnical Commission (IEC) draw attention to the fact that it is claimed that compliance with this document may involve the use of patents concerning radio frequency identification technology given in all parts of this document.

ISO and IEC take no position concerning the evidence, validity and scope of these patent rights.

The holders of these patent rights have assured the ISO and IEC that they are willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statements of the holders of these patent rights are registered with ISO and IEC. Information may be obtained from the following companies.

Information technology — Radio frequency identification for item management —

Part 4: Parameters for air interface communications at 2,45 GHz

1 Scope

This document defines the air interface for radio frequency identification (RFID) devices operating in the 2,45 GHz industrial, scientific, and medical (ISM) band used in item management applications. This document provides a common technical specification for RFID devices that can be used by ISO committees developing RFID application standards. This document is intended to allow for compatibility and to encourage inter-operability of products for the growing RFID market in the international marketplace. This document defines the forward and return link parameters for technical attributes including, but not limited to, operating frequency, operating channel accuracy, occupied channel bandwidth, maximum equivalent isotropically radiated power (EIRP), spurious emissions, modulation, duty cycle, data coding, bit rate, bit rate accuracy, bit transmission order, and where appropriate, operating channels, frequency hop rate, hop sequence, spreading sequence, and chip rate. This document further defines the communications protocol used in the air interface.

This document contains four modes. Mode 1 is an interrogator talks first with passive tag. Mode 2 is a tag talks first with battery-assisted passive tag. Mode 3 is a globally available, ubiquitous network supporting (but not limited to) the logistics and transportation industry; agnostic to any device, commercial or otherwise, requiring global availability. Mode 4 is a configurable data rate active RFID system. It provides the functions of long range objects identification and environmental sense, and it is intended to realize the low cost device and low power consumption, long range identification, fast and reliable tags access. The detailed technical differences between the modes are shown in the parameter tables.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 19762 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1 associated

successful negotiation of a bi-directional wireless link with a coordinator

Note 1 to entry: Associated networks require communication be maintained and monitored for a period of time.

3.2 association

service used to establish membership for a device communicating within the wireless network described in this document

iTeh STANDARD PREVIEW
(standards.iteh.ai)

3.3 authentication ATH

process of determining whether an entity or data is/are who or what, respectively, it claims to be

Note 1 to entry: The types of entity authentication referred to in this document are Tag authentication, Interrogator authentication, and Tag-Interrogator mutual authentication. For data authentication, see *authenticated communications* (3.4).

3.4 authenticated communications

communications in which message integrity is protected

3.5 block cipher

cryptographic function that operates on strings of fixed size

3.6 chip

smallest unit of signal after spectrum spreading

Note 1 to entry: In the spreading process, an information bit is usually represented by a number of coded signals, wherein a coded signal is called a chip.

3.7 coordinator

full-function device (FFD) capable of relaying messages

Note 1 to entry: If a coordinator is the principal controller of a personal area network (PAN), it is called the PAN coordinator.

3.8 data server

device data termination point

3.9**device**

any entity that meets the ISO/IEC/IEEE 8802-15-4 medium access control (MAC), physical interface to the wireless medium, and this document

Note 1 to entry: A device may be a reduced-function device (RFD) or a full-function device (FFD).

3.10**encryption**

transformation of a message into a new representation so that privileged information is required to recover the original representation

3.11**full-function device****FFD**

device capable of operating as a coordinator

3.12**group key**

key that is known only to a set of devices

3.13**hailing channel**

ISO/IEC/IEEE 8802-15-4 radio channel used to broadcast the NDB

3.14**key**

privileged information that may be used, for example, to protect information from disclosure to, and/or undetectable modification by, parties that do not have access to this privileged information

3.15**keyID**

numerical designator for a single key

iTeh STANDARD PREVIEW
(standards.iteh.ai)
<https://standards.iteh.ai/catalog/standards/sist/6f6e62d4-10b2-44e9-bd31-7e7b003b018/iso-iec-18000-4-2018>

3.16**link key**

secret key that is shared between precisely two devices

3.17**mesh networking**

type of network where an FFD serves as a relay for other devices

3.18**message authentication code****MAC1**

code, computed over bits in a message, that an Interrogator or a Tag may use to verify the integrity of the message

3.19**message integrity code****MIC**

data whereby an entity receiving a message corroborates evidence about the true source of the information in the message and, thereby, evidence that the message has not been modified in transit

3.20**network channel**

primary ISO/IEC/IEEE 8802-15-4 radio channel between a coordinator and remote devices

3.21**packet**

formatted, aggregated bits that are transmitted together in time across the physical medium

3.22

password

information that is used to verify identities in the *tag access* (3.29) process

3.23

payload data

contents of a data message that is being transmitted

3.24

reduced-function device

RFD

device that is not capable of operating as a coordinator

3.25

secure communications

communications in which message confidentiality is protected

3.26

security

degree of protection against threats identified in a security policy

Note 1 to entry: A system is secure if it is protected to the degree specified in the security policy.

3.27

server connected coordinator

SCC

network coordinator that terminates the wireless protocol described in this document and is connected to control servers

iTeh STANDARD PREVIEW
(standards.iteh.ai)

3.28

tag

any device type associated with the device and capable of joining the network

ISO/IEC 18000-4:2018

7bcd003b018/iso-iec-18000-4-2018

3.29

tag access

process in which tags establish communication links with interrogators according to certain communication protocols

4 Symbols and abbreviated terms

| | |
|-----------------|--|
