## Guidelines for in-service inspections for primary coolant circuit components of light water reactors —

### Part 1: Mechanized ultrasonic testing

*Lignes directrices pour les contrôles périodiques des composants du  
circuit primaire des réacteurs à eau légère —*

*Partie 1: Contrôle mécanique par ultrasons*

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 85, *Nuclear energy, nuclear technologies, and radiological protection*, Subcommittee SC 6, *Reactor technology*.

A list of all parts in the ISO 20890 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

# Guidelines for in-service inspections for primary coolant circuit components of light water reactors —

## Part 1: Mechanized ultrasonic testing

### 1 Scope

This document gives guidelines for pre-service-inspections (PSI) and in-service inspections (ISI) with mechanized ultrasonic test (UT) devices on components of the reactor coolant circuit of light water reactors. This document is also applicable on other components of nuclear installations.

Mechanized ultrasonic inspections are carried out in order to enable an evaluation in case of

- fault indications (e.g. on austenitic weld seams or complex geometry),
- indications due to geometry (e.g. in case of root concavity),
- complex geometries (e.g. fitting weld seams), or
- if a reduction in the radiation exposure of the test personnel can be attained in this way.

Ultrasonic test methods are defined for the validation of discontinuities (volume or surface open), requirements for the ultrasonic test equipment, for the preparation of test and device systems, for the implementation of the test and for the recording.

This document is applicable for the detection of indications by UT using normal-beam probes and angle-beam probes both in contact technique. It is to be used for UT examination on ferritic and austenitic welds and base material as search techniques and for comparison with acceptance criteria by the national referencing nuclear safety standards. Immersion technique and techniques for sizing are not in the scope of this document and are independent qualified.

**NOTE** Data concerning the test section, test extent, inspection period, inspection interval and evaluation of indications is defined in the applicable national nuclear safety standards.

Unless otherwise specified in national nuclear safety standards the minimum requirements of this document are applicable. This document does not define:

- extent of examination and scanning plans;
- acceptance criteria;
- UT techniques for dissimilar metal welds and for sizing (have to be qualified separately);
- immersion techniques;
- time-of-flight Diffraction technique (TOFD).

It is recommended that UT examinations are nearly related to the component, the type and size of defects to be considered and are reviewed in specific national inspection qualifications.

### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 5577, *Non-destructive testing — Ultrasonic testing — Vocabulary*

ISO 9712, *Non-destructive testing — Qualification and certification of NDT personnel*

ISO 16811, *Non-destructive testing — Ultrasonic testing — Sensitivity and range setting*

ISO 18490, *Non-destructive testing — Evaluation of vision acuity of NDT personnel*

EN 12668-1, *Non-destructive testing — Characterization and verification of ultrasonic examination equipment — Part 1: Instruments*

EN 12668-2, *Non-destructive testing — Characterization and verification of ultrasonic examination equipment — Part 2: Probes*

ISO 18563-1, *Non-destructive testing — Characterization and verification of ultrasonic phased array equipment — Part 1: Instruments*

ISO 18563-2, *Non-destructive testing — Characterization and verification of ultrasonic phased array equipment — Part 2: Probes*

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 5577 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at <https://www.iso.org/obp>

— IEC Electropedia: available at <http://www.electropedia.org/>

#### 3.1 analysis scan

test scan with adopted parameters that is required for more precise characterisation of an *indication* (3.3)

#### 3.2 analysis technique

test technique that is applied for more precise characterisation of *indications* (3.3) subject to analysis

#### 3.3 indication

representation or signal from a discontinuity in the format allowed by the NDT method used

[SOURCE: ISO/TS 18173:2005, 2.14]

Note 1 to entry: Signal that is initiated by operationally induced damage mechanisms, geometrical as well as, material or design induced influences

#### 3.4 evaluation

*assessment* (3.5) of *indications* (3.3) revealed by NDT against a predefined level

Note 1 to entry: Inspection of the recorded measured data in respect to completeness and analysis capacity, localisation and registration of indications according to defined criteria, representation of the test results

[SOURCE: EN 1330-2:1998, 2.10]

#### 3.5 assessment

comparison of the analysed measuring results with specified criteria

**3.6****data storage medium**

storage medium for storing digital media

**3.7****focal length**

focal distance

distance from the probe to the focal point

[SOURCE: ISO 5577:2017, 4.2.13]

**3.8****focus range**

focal zone

zone in sound beam of a probe in which the sound pressure remains above a defined level related to its maximum

[SOURCE: ISO 5577:2017, 4.2.14]

Note 1 to entry: During measurement with the electrodynamic probe in sound transmission, this value corresponds to a decrease in the signal level by 3 dB in comparison to the maximum value.

Note 2 to entry: In general limitation by the decline in the signal level by 6 dB.

**3.9****focus depth****focal point**

point where the sound pressure on the beam axis is at its maximum

[SOURCE: ISO 5577:2017, 4.2.12]

**3.10****adjustment**

setting the ultrasonic test device based on specified parameters

**3.11****calibration**

<ultrasonic testing> determination of the measuring value range of an ultrasonic test device in relation to a calibrated test standard

**3.12****calibration block**

<ultrasonic testing> piece of material of specified composition, surface finish, heat treatment and geometric form, by means of which *ultrasonic test equipment* (3.43) can be assessed and calibrated

[SOURCE: ISO 5577:2017, 5.4.1]

Note 1 to entry: The calibration blocks according to ISO 2400 and ISO 7963 can be used as calibration blocks according to this document.

**3.13****calibration reflector**

reflector of a known geometry and size in or on the *calibration block* (3.12), *test reference block* (3.15) and the test *calibration block*, for distance or sensitivity adjustment of the *ultrasonic test instrument* (3.44)

**3.14****component**

part of a system delimited according to structural or functional aspects, which can still implement independent sub-functions

### 3.15

#### reference block

block of material representative of the material to be tested with similar acoustic properties containing well-defined reflectors, used to adjust the sensitivity and/or time base of the *ultrasonic instrument* (3.44) in order to compare detected discontinuity *indications* (3.3) with those arising from the known reflectors

[SOURCE: ISO 5577:2017, 5.4.2]

### 3.16

#### time of flight

time it takes an ultrasonic pulse to travel from the transmitter probe through the *test object* (3.27) to the receiver probe

[SOURCE: ISO 5577:2017, 3.2.6]

Note 1 to entry: This comprises the lead time in the UT probe and the time of flight in the component; it is the time that an ultrasonic pulse requires from the oscillator to a reflector and back to the oscillator.

### 3.17

#### LLL technique

test technique based on the reflection of the sound package at the back wall and at a planar reflector in the inspection volume using /utilizing longitudinal waves

Note 1 to entry: See [Annex A](#), no. 7.

### 3.18

#### LLT technique

test technique based on reflection of the sound bundle at the back wall and at a planar reflector in the inspection volume using /utilizing the mode conversion of longitudinal waves and transversal waves

Note 1 to entry: See [Annex A](#), no. 7.

### 3.19

#### measurement scan

movement of the UT probes with simultaneous recording of measured data

### 3.20

#### raw data

all measured data and setting parameters saved by the ultrasonic test equipment during the measurement run (recorded and saved data)

Note 1 to entry: Examples of raw data include amplitude, time of flight, and coordinates.

### 3.21

#### test section

part of the *test area* (3.23)

### 3.22

#### test supervisor

responsible for application of the test method and for the individual details of the test implementation including monitoring of the activities for preparation and implementation of the test as well as analysis of the *test results* (3.24)

### 3.23

#### test area

defined area on the *test object* (3.27) over which the tests are to be conducted

[SOURCE: ISO 5577:2017, 6.2.2]

**3.24****test result**

summarising evaluation of all measured data and comparison with the previous test

**3.25****test scan**

measuring run with the characteristics specified in the test specifications

**3.26****test function**

test task assigned to a UT probe or UT probe combination, e.g. coupling check

**3.27****test object**

object to be tested; object under test or examination; part of a component to be tested

**3.28****test robots**

scanner

mechanical device with control for guiding the UT probes

**3.29****noise level**

amplitudes of background noise in an ultrasonic system

Note 1 to entry: 95 % value of the sum frequency of the amplitudes, measured during the reference run or test run in an indication-free range

[SOURCE: ISO 5577:2017, 6.5.16]

**3.30****signal to noise ratio**

ratio of the amplitude of a signal arising from a discontinuity in a material to the amplitude of the average background *noise level* (3.29)

[SOURCE: EN 1330-2:1998, 2.16]

**3.31****reference scan**

measuring run for the functional control and functional adaptation of the ultrasonic test equipment

**3.32****hysteresis correction**

correction to the decrease in the calibration level resulting during the tandem test or during the test with a comparable test system, if the planar reflectors are not oriented vertically to the surface or vertically to the sound incidence level

**3.33****transmitter-receiver technique (TR-technique)****pitch and catch technique****double probe technique**

ultrasonic testing technique involving the use of two probes both of which can be used as transmitter and receiver

**3.34****track offset correction**

correction to the decrease in the calibration level of planar reflectors in the middle between two tracks

**3.35****tandem zone correction**

correction to the decrease in the calibration level of the calibration reflector to the tandem zone edges

**3.36**

**test block**

defined piece of material which allows tests for the accuracy and/or performance of an *ultrasonic test system* (3.43)

[SOURCE: ISO 5577:2017, 5.4.3]

Note 1 to entry: Specimen for examining properties of a test method, an ultrasonic test instrument or a test system.

**3.37**

**depth zone**

sub-range of the wall thicknesses to be tested

**3.38**

**transfer correction**

correction of the gain setting of the *ultrasonic test instrument* (3.44) when transferring the probe from a *calibration* (3.12) or *reference block* (3.15) to the test object

[SOURCE: ISO 5577:2017, 5.4.5]

**3.39**

**trigger distance**

path that the UT probes travels between two test cycles of the same test function following in succession

**3.40**

**scan without couplant**

*measurement scan* (3.19) without coupling between the UT probe and *test object* (3.27)

**3.41**

**TTT technique**

test technique based on reflection of the sound bundle at the back wall and at a planar reflector in the test volume using / utilizing shear waves

Note 1 to entry: See [Annex A](#), no. 7.

**3.42**

**ultrasonic test equipment**

equipment consisting of an *ultrasonic instrument* (3.44), probes, cables and all devices connected to the instrument during testing

[SOURCE: ISO 5577:2017, 5.3.1]

Note 1 to entry: Connected devices consist also test robot and analysis unit including software, digitalisation unit and, if necessary, operating PC including software.

**3.43**

**ultrasonic test instrument**

instrument used together with the probe or probes, which transmits, receives, processes and displays ultrasonic signals for NDT purposes

[SOURCE: ISO 5577:2017, 5.1.1]

**3.44**

**ultrasonic test technique**

application-relevant technique for the localisation of discontinuities (internal or surface open)

Note 1 to entry: In relation to the application, requirements result for these ultrasonic test techniques in respect to the test parameters such as oscillation variable, beam angle, wave type and frequency.

Note 2 to entry: Test techniques are e.g. pulse-echo system (PE), transmitter-receiver system (TR), tandem system, phased-array system (PA).
