Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 67, *Materials, equipment and offshore structures for petroleum, petrochemical and natural gas industries*, Subcommittee SC 6, *Processing equipment and systems*.

This second edition cancels and replaces the first edition (ISO 27509:2012), which has been technically revised.

The main changes from the previous edition have been made to reduce risk of mistakes and quality issues, which have been the major cause to a limited use of the first edition of this document. The main changes are as follows:

- Annexes B and D (Annex E in previous edition) have become normative annexes, because they contain requirements.
- More stringent quality requirements regarding manufacture of products and assembly instructions have been introduced. These include:
 - ultrasonic testing of products according to new requirements in ASME VIII div. 2 (in Clause 7);
 - the importance of stringent requirements to material strength and machining strictly according to given tolerances for IX seal rings (in Clause 12);
 - new and better coating requirements for IX seal rings (in Clause 13 and Annex D);
 - requirements about quality assurance and control and conformance of products according to EN 10204.3.1 (in Clause 15);

- excluding use of IX seal rings to assist alignment by transfer of significant shear load during assembly (in Annex D)
 - more comprehensive and detailed guidelines on the evaluation of damages to products and the repair of such damages (in Annex D);
 - more comprehensive requirements to qualification of bolt tensioning procedures (in Annex D).
- The elastoplastic deformation of flanges by first assembly has been better explained in 5.3 and in Annex D, in order to prevent unnecessary re-machining or rejection when flange bevel angles have changed.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

SIST EN ISO 27509:2021

<https://standards.iteh.ai/catalog/standards/sist/86a5b66b-2664-4769-969f-854faac41a04/sist-en-iso-27509-2021>

Introduction

This document, which is originally based on NORSOK L-005, has been developed to provide a standard for compact flanged connections (CFCs) that constitutes an alternative to conventional flanges as specified in ASME standards, European Standards and other International Standards, with reduced mass and smaller overall dimensions, as well as increased reliability in leak tightness by means of its inherent design features and make up procedures. CFCs can also provide an alternative to other types of clamp and hub type mechanical connectors.

The use of load carrying sealing elements, traditionally referred to as "gaskets", does not comply with the fundamental requirements of this document.

This document has been developed for use in process piping systems, which are designed according to codes for pressure piping, e.g. ASME B31.3. See 5.7 for more details.

The flange designs have been selected to achieve a minimum safety factor of 2,0 when subjected to a design pressure equal to ASME B16.5 pressure temperature ratings within the temperature limits of this document.

The main body of this document contains all necessary information on how to manufacture and supply flange and seal ring materials, such as:

- flange dimensions and material requirements;
- seal ring dimensions and material requirements;
- bolting dimensions and material requirements;
- requirements to tolerances and surface finish;
- requirements to designation and marking of finished products.

The normative annexes A, B, C and D cover the following topics:

- structural capacity equations for flange assemblies;
- how to apply the flanges to special geometries of valves and equipment nozzles;
- bolt dimensions and masses;
- installation and assembly instructions, and guidelines on how to repair damage and irregularities on sealing surfaces.

The informative annexes E, F and G cover the following topics:

- masses of all standard components;
- suitable dimensions of alternative metric bolting;
- additional information on bibliographical references.

For the purposes of this document, the following verbal forms apply:

- "shall" indicates a requirement strictly to be followed in order to conform to this document and from which no deviation is permitted, unless accepted by all involved parties;
- "should" indicates that among several possibilities one is recommended as particularly suitable, without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required;
- "may" indicates a course of action permissible within the limits of this document;
- "can" is used for statements of possibility and capability, whether material, physical or casual.

Petroleum and natural gas industries — Compact flanged connections with IX seal ring

1 Scope

This document specifies detailed manufacturing requirements for circular steel and nickel alloy compact flanged connections and associated seal rings, for designated pressures and temperatures in class designations CL 150 (PN 20) to CL 1500 (PN 260) for nominal sizes from DN 15 (NPS ½) to DN 1200 (NPS 48), and for CL 2500 (PN 420) for nominal sizes from DN 15 (NPS ½) to DN 600 (NPS 24).

NOTE NPS is in accordance with ASME B36.10M and ASME B36.19M.

This document is applicable to welding neck flanges, blind flanges, paddle spacers and spacer blinds (paddle blanks), valve/equipment integral flanges, orifice spacers, reducing threaded flanges and rigid interfaces for use in process piping for the petroleum, petrochemical and natural gas industries.

This document is applicable within a temperature range from –196 °C to +250 °C.

This document is not applicable for external pressure.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

3.1

class

ASME pressure class in accordance with ASME B16.5 and ASME B16.34

3.2

compact flanged connection

non-gasketed bolted static pipe connection including two flanges and where the bolt loads are transferred through metal to metal contact between the flange faces

3.3

gasket

barrier to prevent the passage of fluids, but which does transmit all loads between flanges

3.4

purchaser

individual or organization that buys the pipe connection on behalf of the user and/or operator or for its own use

3.5

seal

component providing a barrier to prevent the passage of fluids, transmitting no significant loads between the flanges

3.6

supplier

individual or organization that takes the responsibility for the supply of the pipe connection and its conformance with this document

4 Abbreviations and symbols

4.1 Abbreviated terms

BL	blind flange
CFC	compact flanged connection
CL	class
DN	nominal pipe diameter (expressed in millimetres)
ID	internal diameter
IF	integral flange (as part of some other equipment or component)
IX	special metallic seal ring applied in this document
LB	line blinds (including PS and PB)
NPS	nominal pipe size (expressed in inches)
OD	outer diameter
OS	orifice spacer
PB	paddle blank
PN	nominal pressure (expressed in bar)
PS	paddle spacer
PTFE	polytetrafluoroethylene
RI	rigid interface
RT	reducing threaded flange
WN	weld neck

4.2 Symbols

A	outside diameter of neck
A_{\max}	maximum outer diameter to accommodate standard tools
A_{\min}	minimum neck outer diameter listed in Table 7 to Table 12
$Area_{015}$	cross-sectional area of the neck/pipe calculated from t_{015}
$Area_{\text{eqv}}$	cross-sectional area of a special flange neck geometry calculated from Formula (B.5)
A_b	total cross-sectional area of bolting, based on root area
B	bore diameter, where the bore should not exceed the maximum listed bore in this document
