## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 256, *Pigments, dyestuffs and extenders*.

A list of all parts in the ISO 18473 series can be found on the ISO website.

## Introduction

Fumed silica (pyrogenic silicon dioxide) is one kind of pure amorphous white inorganic powder which has high specific surface area, nano-scale primary particle size resulting in a “stable/none destroyable” aggregated structure, and a relatively high (among silica products) concentration of surface silanol groups. The properties of fumed silica can be chemically modified by reaction with these silanol groups. Commercial available fumed silica can be divided into two groups: hydrophilic fumed silica and hydrophobic fumed silica. Because of the above-mentioned features, it is widely used as an important ingredient in many industries such as the rubber, paint and plastics industries. The major application for fumed silica is the silicone rubber industry.

Silicone rubbers exhibit excellent properties, such as flexibility at low temperature, good weather resistance, electric insulation, media resistance, physiological inertia, low surface tension and surface energy, which permit them to fulfil important needs in the market. However, these unique properties cannot be demonstrated effectively without reinforcing filler due to the low strength ( $< 0,4$  MPa) of cured polydimethylsiloxane (PDMS) which is the main component of silicones; therefore, silicone rubber usually contains reinforcing filler besides additive and curing agent. Fumed silica as one of the functional fillers, which is used widely in room temperature vulcanized silicone rubber (RTV), high temperature vulcanized silicone rubber (HTV) or high consistency vulcanized silicone rubber (HCR) and liquid silicone rubber (LSR), plays an important role in the strength, rheological and transparency properties of the silicone polymer. The testing methods for the dispersed fumed silica aggregate size and the silanol density, which both have obvious effects on the above properties of silicone rubber, are still being developed.
