
**Acoustics — Noise emitted by
machinery and equipment —
Determination of emission sound
pressure levels at a work station
and at other specified positions
applying approximate environmental
corrections**

AMENDMENT 1

*Acoustique — Bruit émis par les machines et équipements —
Détermination des niveaux de pression acoustique d'émission au
poste de travail et en d'autres positions spécifiées en appliquant des
corrections d'environnement approximatives*

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 43, *Acoustics*, Subcommittee SC 1, *Noise*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Acoustics — Noise emitted by machinery and equipment — Determination of emission sound pressure levels at a work station and at other specified positions applying approximate environmental corrections

AMENDMENT 1

3.20, Note 2

Replace the note with the following:

"The work station can be located on the reference measurement surface, but this is not necessary. The reference measurement surface can be used to determine K_2 ."

3.21, Note 2

Replace the note with the following:

"For the purposes of this International Standard, the environmental correction, K_2 , is used as an indicator to qualify the environment in 6.2 and is used to calculate the local environmental correction K_3 in A.2."

3.26

ISO 11202:2010/Amd 1:2020

Replace the definition and Note with the following:

"mean distance from the work station to the closest major sound source of the machine under test, without screening objects protruding into the line of sight between the major sound source and the work station, given by:

$$d = \frac{d_2 + d_1}{2}$$

where

d_1 is the shortest distance from the sound radiating surface of the machine under test to the work station;

d_2 is the longest distance from the sound radiating surface of the machine under test to the work station"

12.5

In the Example, replace "sound power level" with "emission sound pressure level".

A.1.2, Equation (A.1)

Replace "(minimum 1 m)" with "(minimum 0,5 m)".

A.2.3

Add the following after the last paragraph:

"When measurements of both emission sound pressure and sound power are required, it can be expedient to use the same measurement surface in both cases. This is not a requirement; the optimum measurement surface for a sound power measurement (e.g. a hemisphere) is not always the best measurement surface for determination(s) of emission sound pressure level(s) around a machine.

NOTE Different measurement surfaces give different values for K_2 "

A.2.5

After Figure A.3, replace:

"The accuracy can be upgraded in some cases from 3 to 2 by"

with

"The accuracy can be upgraded in some cases from grade 3 to grade 2 by"

A.2.5

Replace the last sentence with:

"If this is not possible, determination in accordance with ISO 11204^[18] can improve the accuracy."

C.4.2

Replace the title with:

"Contributions to the uncertainty, σ_{R0} , when the estimate of the local environmental correction, K_3 , is based on a localized and well-defined sound-radiating area of the machine surface"

New C.4.3

Add the following after C.4.2, renumber the following equations and update cross-references accordingly:

"C.4.3 Contributions to the uncertainty, σ_{R0} , when the estimate of the local environmental correction, K_3 , is based on an approximate determination of the apparent work station directivity index

The general expression for the calculation of the final result of the emission sound pressure level measurement is identical to the formulation in C.4.2, with the addition of a term related to the apparent work station directivity index, D_{1op}^* , and replacing the contribution from the local environmental
