Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 45, *Rubber and rubber products*, Subcommittee SC 4, *Products (other than hoses)*.

This third edition cancels and replaces the second edition (ISO 22762-1:2010), which has been technically revised.

The main changes compared to the previous edition are as follows: 539ae8d850fiso-22762-1-2018

- the definitions of some symbols in <u>Clause 4</u> have been changed;
- the number of test pieces and the thickness of the metal plates have been added in <u>5.8.3</u>;
- alleviation of the restriction on the upper value of the ageing temperature in 6.6.1.4.

A list of all parts in the ISO 22762 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

ISO 22762 series includes two parts related to specifications for isolators, i.e. ISO 22762-2 for bridges and ISO 22762-3 for buildings. This is because the isolator requirements for bridges and for buildings are quite different, although the basic concept of the two products is similar. Therefore, ISO 22762-2 and the relevant clauses in this document are used when ISO 22762 (all parts) is applied to the design of bridge isolators, whereas ISO 22762-3 and the relevant clauses of this document are used when it is applied to building isolators.

The main differences to be noted between isolators for bridges and isolators for buildings are the following.

- a) Isolators for bridges are mainly rectangular in shape and those for buildings are circular in shape.
- b) Isolators for bridges are designed to be used for both rotation and horizontal displacement, while isolators for buildings are designed for horizontal displacement only.
- c) Isolators for bridges are designed to perform on a daily basis to accommodate length changes of bridges caused by temperature changes as well as during earthquakes, while isolators for buildings are designed to perform only during earthquakes.
- d) Isolators for bridges are designed to withstand dynamic loads caused by vehicles on a daily basis as well as earthquakes, while isolators for buildings are mainly designed to withstand dynamic loads caused by earthquakes only.

For structures other than buildings and bridges (e.g. tanks), the structural engineer uses either ISO 22762-2 or ISO 22762-3, depending on the requirements of the structure.

ISO 22762-1:2018

Elastomeric seismic-protection isolators —

Part 1:

Test methods

1 Scope

This document specifies the test methods for determination of

- a) the properties of the rubber material used to manufacture the elastomeric seismic isolators, and
- b) the characteristics of elastomeric seismic isolators.

It is applicable to elastomeric seismic isolators used to provide buildings or bridges with protection from earthquake damage. The isolators covered consist of alternate elastomeric layers and reinforcing steel plates which are placed between a superstructure and its substructure to provide both flexibility for decoupling structural systems from ground motion, and damping capability to reduce displacement at the isolation interface and the transmission of energy from the ground into the structure at the isolation frequency.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at http://www.iso.org/obp/
- IEC Electropedia: available at http://www.electropedia.org/

3.1

breaking

rupture of *elastomeric isolator* (3.9) due to compression- (or tension-) shear loading

3.2

buckling

state when *elastomeric isolators* (3.9) lose their stability under compression-shear loading

3.3

compressive stiffness

 K_{v}

compressive stiffness for all types of rubber bearings 19219018

3.4 https://standards.iteh.ai/catalog/standards/iso/81eb4967-32c7-40ff-8d65-3539ae8d850f/iso-22762-1-2018

compression-shear testing machine

machine used to test *elastomeric isolators* (3.9), which has the capability of shear loading under constant compressive load

3.5

cover rubber

rubber wrapped around the outside of inner rubber and reinforcing steel plates before or after curing of *elastomeric isolators* (3.9) for the purposes of protecting the inner rubber from deterioration due to oxygen, ozone and other natural elements and protecting the reinforcing plates from corrosion

3.6

design compressive stress

long-term compressive force on the *elastomeric isolator* (3.9) imposed by the structure

3.7

effective loaded area

area sustaining vertical load in *elastomeric isolators* (3.9), which corresponds to the area of reinforcing steel plates

3.8

effective width

<rectangular elastomeric isolator> the smaller of the two side lengths of inner rubber to which direction
shear displacement is not restricted

3.9

elastomeric isolator

rubber bearing, for seismic isolation of buildings, bridges and other structures, which consists of multilayered vulcanized rubber sheets and reinforcing steel plates

EXAMPLE High-damping rubber bearings, linear natural rubber bearings and lead rubber bearings.

3.10

first shape factor

ratio of effective loaded area to free deformation area of one inner rubber layer between steel plates

high-damping rubber bearing

HDR

elastomeric isolator (3.9) with relatively high damping properties obtained by special compounding of the rubber and the use of additives

3.12

inner rubber

rubber between multi-layered steel plates inside an *elastomeric isolator* (3.9)

lead rubber bearing

LRB

elastomeric isolator (3.9) whose inner rubber (3.12) with a lead plug or lead plugs press fitted into a hole or holes of the isolator body to achieve damping properties

linear natural rubber bearing / Standards.iteh.ai)

elastomeric isolator (3.9) with linear shear force-deflection characteristics and relatively low damping properties, fabricated using natural rubber

Note 1 to entry: Any bearing with relatively low damping can be treated as an LNR bearing for the purposes of isolator testing.

3.15

maximum compressive stress

peak stress acting briefly on *elastomeric isolators* (3.9) in compressive direction during an earthquake

3.16

nominal compressive stress

long-term stress acting on *elastomeric isolators* (3.9) in compressive direction as recommended by the manufacturer for the isolator, including the safety margin

3.17

post-vield stiffness

shear stiffness of LRB

3.18

roll-out

instability of an isolator with either dowelled or recessed connection under shear displacement

3.19

routine test

test for quality control of the production isolators during and after manufacturing

3.20

second shape factor

<circular elastomeric isolator> ratio of the diameter of the inner rubber to the total thickness of the inner rubber

3.21

second shape factor

<rectangular or square elastomeric isolator> ratio of the effective width of the inner rubber to the total
thickness of the inner rubber

3.22

shear properties

comprehensive term that covers characteristics determined from isolator tests:

- shear stiffness, K_h, for LNR;
- shear stiffness, K_h , and equivalent damping ratio, h_{eq} , for HDR and LRB;
- post-yield stiffness, K_d , and characteristic strength, Q_d , for LRB

3.23

shear stiffness

shear stiffness of LNR and HDR

3.24

structural engineer

engineer who is in charge of designing the structure for base-isolated bridges or buildings and is responsible for specifying the requirements for *elastomeric isolators* (3.9)

3.25

property

property at either buckling, breaking, or roll-out of an isolator under compression-shear loading

4 Symbols and cross-section of isolator

4.1 Symbols

For the purposes of this document, the symbols given in <u>Table 1</u> apply.

Table 1 — Symbols and descriptions

Symbol	Description
Α	effective plan area; plan area of elastomeric isolator, excluding cover rubber portion
A_{b}	effective area of bolt
Ae	overlap area between the top and bottom elastomer area of isolator
A_{free}	load-free area of isolator
A_{load}	loaded area of isolator
A_{p}	area of the lead plug for a lead rubber bearing
а	side length of square elastomeric isolator, excluding cover rubber thickness, or length in longitudinal direction of rectangular isolator, excluding cover rubber thickness
a_{e}	length of the shorter side of the rectangular isolator, including cover rubber thickness
a'	length in longitudinal direction of the rectangular isolator, including cover rubber thickness
В	effective width for bending of flange
b	length in transverse direction of the rectangular isolator, excluding cover rubber thickness
b'	length in transverse direction of the rectangular isolator, including cover rubber thickness
С	distance from centre of bolt hole to effective flange section
D'	outer diameter of circular isolator, including cover rubber
D_{f}	diameter of flange
d_{i}	inner diameter of reinforcing steel plate

 Table 1 (continued)

Symbol	Description
$d_{\mathbf{k}}$	diameter of bolt hole
d_0	outer diameter of reinforcing steel plate
E_{ap}	apparent Young's modulus of bonded rubber layer
$E_{\rm c}$	apparent Young's modulus corrected, if necessary, by allowing for compressibility
E_{c}^{s}	apparent Young's modulus corrected for bulk compressibility depending on its shape factor (S_1)
E_{∞}	bulk modulus of rubber
E_0	Young's modulus of rubber
F_{u}	tensile force on isolator by uplift
G	shear modulus
$G_{\mathrm{eq}}(\gamma)$	equivalent linear shear modulus at shear strain
Н	height of elastomeric isolator, including mounting flange
$H_{\rm n}$	height of elastomeric isolator, excluding mounting flange
h_{eq}	equivalent damping ratio
$h_{\rm eq}(\gamma)$	equivalent damping ratio as a function of shear strain
$K_{\rm d}$	post-yield stiffness (tangential stiffness after yielding of lead plug) of lead rubber bearing
K _h	shear stiffness
K _i	initial shear stiffness
K _p	shear stiffness of lead plug inserted in lead rubber bearing
$K_{\rm r}$	shear stiffness of lead rubber bearing before inserting lead plug
K _t	tangential shear stiffness
$K_{\rm V}$	companying at iffying
$L_{ m f}$	length of one side of a rectangular flange
M	resistance to rotation
M_{f}	moment acting on bolt ISO 22/62-12018
s://stmdard	moment acting on isolator So/81eb490/-32c/-40II-8d05-3539ae8d850I/Iso-22/02-1-2018
n	number of rubber layers
n_{b}	number of fixing bolts
P	compressive force
P_0	design compressive force in absence of seismic action effects
P_{\max}	maximum compressive force including seismic action effects
P_{\min}	minimum compressive force including seismic actions effects
Q	shear force
$Q_{ m b}$	shear force at break
$Q_{ m buk}$	shear force at buckling
$Q_{ m d}$	characteristic strength
S_1	first shape factor
S_2	second shape factor
T	Temperature
$T_{ m L}$	minimum temperature
T_0	standard temperature, 23 °C or 27 °C
-	where specified tolerance is \pm 2 °C, it is standard laboratory temperature
$T_{\rm r}$	total rubber thickness, given by $T_r = n \times t_r$
$t_{\rm r}$	thickness of one rubber layer
t_{r1}, t_{r2}	thickness of rubber layer laminated on each side of plate
	· · · · · · · · · · · · · · · · · · ·

Table 1 (continued)

Symbol	Description
$t_{ m S}$	thickness of one reinforcing steel plate
t_0	thickness of outside cover rubber
$U(\gamma)$	function giving ratio of characteristic strength to maximum shear force of a loop
V	uplift force
v	loading velocity
$W_{\rm d}$	energy dissipated per cycle
X	shear displacement
<i>X</i> ₀	design shear displacement
X _b	shear displacement at break
X _{buk}	shear displacement at buckling
X_{S}	shear displacement due to quasi-static shear movement
X _{max}	maximum shear displacement
X_{d}	shear displacement due to dynamic shear movement
Y	compressive displacement
Z	section modulus of flange
α	coefficient of linear thermal expansion
γ	shear strain
γ0	design shear strain Tell Stalluards
γa	upper limit of the total of design strains on elastomeric isolators
γb	shear strain at break shear strain at break
γс	local shear strain due to compressive force
γd	shear strain due to dynamic shear movement
γmax	maximum design shear strain during earthquake
γr	local shear strain due to rotation
hγs://s	shear strain due to quasi-static shear movement -32c/-4UII-8d03-3339ae8d83UVB0-22/02-1-2
γu	ultimate shear strain
$\delta_{ m H}$	horizontal offset of isolator
$\delta_{ m v}$	difference in isolator height measured between two points at opposite extremes of the isolator
ε	compressive strain of rubber
$\varepsilon_{\mathrm{cr}}$	creep strain
$\varepsilon_{ m T}$	tensile strain of isolator
ϵ_{Tb}	tensile-break strain of isolator
$arepsilon_{\mathrm{Ty}}$	tensile-yield strain of isolator
ζ	ratio of total height of rubber and steel layers to total rubber height
θ	rotation angle of isolator about the diameter of a circular bearing or about an axis through a rectangular bearing
θ_{a}	rotation angle of isolator in the longitudinal direction (a)
$ heta_{ m b}$	rotation angle of isolator in the transverse direction (b)
λ	correction factor for calculation of stress in reinforcing steel plates
η	correction factor for calculation of critical stress
К	correction factor for apparent Young's modulus according to hardness
Σγ	total local shear strain
σ	compressive stress in isolator
σ_0	design compressive stress

 Table 1 (continued)

Symbol	Description
$\sigma_{ m B}$	tensile stress in bolt
$\sigma_{ m b}$	bending stress in flange
$\sigma_{ m bf}$	allowable bending stress in steel
$\sigma_{ m cr}$	critical stress in isolator
$\sigma_{ m f}$	allowable tensile stress in steel
$\sigma_{ m max}$	maximum design compressive stress
$\sigma_{ m min}$	minimum design compressive stress
$\sigma_{ m nom}$	for building: nominal compressive stress recommended by manufacturer
$\sigma_{ ext{S}}$	tensile stress in reinforcing steel plate
σ_{sa}	allowable tensile stress in steel plate
$\sigma_{ m Sy}$	yield stress of steel for flanges and reinforcing steel plates
$\sigma_{ m su}$	tensile strength of steel for flanges and reinforcing steel plates
σ_{t}	tensile stress
σ_{te}	allowable tensile stress in isolator
$ au_{ m B}$	shear stress in bolt
$ au_{ m f}$	allowable shear stress in steel
φ	factor for computation of buckling stability
ξ	factor for computation of critical stress

4.2 Cross-section of isolator / standards.iteh.ai)

A typical cross-section of the isolator is given in Figure 1.

ISO 22762-1:2018

Key

- 1 lead plug
- 2 cover rubber added after isolator cured
- 3 cover rubber cured with insulator

NOTE The left-hand side of the figure shows LNR and HDR, the right hand side shows LRB.

Figure 1 — Cross-section of isolator
