This draft European Standard is submitted to CENELEC members for enquiry.
Deadline for CENELEC: 2021-10-29.

It has been drawn up by CLC/TC 17AC.

If this draft becomes a European Standard, CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CENELEC in three official versions (English, French, German).
A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

<https://standards.iteh.ai/catalog/standards/sist/799ced0e-81ce-4029-a2d3-8ccd1a10cb3c/osist-pr-en-50187-2021>

34 European foreword

35 This document [prEN 50187:2021] has been prepared by CLC/TC17AC "High-voltage switchgear and
36 controlgear".

37 This document is currently submitted to the Enquiry.

38 The following dates are proposed:

- latest date by which the existence of this document has to be announced at national level (doa) dor + 6 months
- latest date by which this document has to be implemented at national level by publication of an identical national standard or by endorsement (dop) dor + 12 months
- latest date by which the national standards conflicting with this document have to be withdrawn (dow) dor + 36 months (to be confirmed or modified when voting)

39 This document will supersede EN 50187:1996 and all its amendments and corrigenda (if any).

40 This edition includes the following significant technical changes with respect to EN 50187:1996:

- ITeH STANDARD PREVIEW**
(standards.iteh.ai)
- 41 ▪ Consistency with EN 62271-200;
 - 42 ▪ Added references to quality standards for welding;
 - 43 ▪ Added Clause 11 on transport; [oSIST prEN 50187:2021](https://standards.iteh.ai/catalog/standards/sist/799ced0e-81ce-4029-a2d3-8ced1a10cb3c/osist-pr-en-50187-2021)
 - 44 ▪ Removal of the limitation on maximum product pressure x volume of 2 000 bar litres in the scope;
 - 45 ▪ Removal of the 300 kPa design pressure limitation;
 - 46 ▪ Compressed air, natural origin gases, alternative fluorinated compounds used alone or in gas mixtures with
47 natural-origin gases¹ are added in the scope.

48 The present document has been established as an international specification for the design, construction,
49 testing and certification of pressurized compartments used in high-voltage switchgear and controlgear,
50 regarding safety aspects.

51 In this respect, this document constitutes the exclusion of HV switchgear from the scope of the Directive
52 2014/68/EU (superseding 97/23/EC) concerning pressure equipment. Article 1, 2. (l) excludes "compartments
53 for high-voltage electrical equipment such as switchgear, controlgear, transformers, and rotating machines"
54 from the scope of the Directive.

55 This document supplements the general specifications given in EN 62271-200 in that it provides specific
56 requirements for pressurized gas-filled compartments of high-voltage switchgear and controlgear.

57 Due to the compartment geometries dictated by electrical and installation conditions they require the verification
58 of the design by proof tests instead of calculations.

59 National deviations from this European Standard are listed in Annex A (informative).

¹ Compressed air, natural-origin gases and alternative fluorinated compounds used alone or in gas mixtures with natural origin gases are described in future edition 2 of IEC 62271-4.

60 Introduction

61 This document covers the requirements for the design, construction, testing, transportation, inspection and
 62 certification of gas-filled compartments with maximum allowable pressure above 50 kPa (relative), for use in AC
 63 switchgear and controlgear or for associated gas-filled equipment. Special consideration is given to these
 64 compartments for the following reasons:

- 65 a) The compartments usually form the containment of electrical equipment; thus, their shape is determined
 66 by electrical rather than mechanical requirements.
- 67 b) The compartments are installed in restricted areas and the equipment is operated by instructed, authorized
 68 persons only.
- 69 c) Compartments are normally filled with a thoroughly dried gas or gas mixture that is stable and non-corrosive
 70 in the conditions that prevail inside the compartment. For this reason, no internal corrosion allowance is
 71 required on the wall thickness of these compartments.
- 72 d) The compartments are subjected to only small fluctuations of pressure as the gas-filling density will be
 73 maintained within close product related limitations to ensure satisfactory insulating and arc-quenching
 74 properties. Therefore, the compartments are not liable to fatigue due to pressure cycling.
- 75 e) The operating pressure is relatively low.

76 Due to the foregoing reasons and to ensure the maximum service continuity as well as to reduce the risk of
 77 moisture and dust entering the compartments which could endanger safe electrical operation of the switchgear,
 78 no pressure tests should be carried out after installation and before placing in service and no periodic inspection
 79 of the compartment interiors or pressure tests should be carried out after the equipment is placed in service.

80 Current known gases and gas mixtures which have been applied or proposed to be applied in high-voltage gas-
 81 filled switchgear and controlgear are: [oSIST prEN 50187:2021](https://standards.iteh.ai/catalog/standards/sist/799ced0e-81ce-4029-a2d3-8ccd1a10cb3c/osist-pren-50187-2021)

- 82 • Sulphur Hexafluoride (SF₆) <https://standards.iteh.ai/catalog/standards/sist/799ced0e-81ce-4029-a2d3-8ccd1a10cb3c/osist-pren-50187-2021>
- 83 • SF₆ mixtures with N₂ and with CF₄
- 84 • Compressed air
- 85 • Natural-origin gases and their mixtures (N₂, O₂, CO₂)
- 86 • C₅F₁₀O (C₅-FK) in mixtures with natural-origin gases (C₅-FK mixtures)
- 87 • C₄F₇N (C₄-FN) in mixtures with natural-origin gases (C₄-FN mixtures)
- 88 • C₃H₂F₄ (HFO1234zeE)

89 Other gases and gas mixtures based or not on those mentioned above which comply with the condition c) above
 90 are possible to apply this document.

91 **1 Scope**

92 This document applies to pressurized compartments (gas-filled compartments with maximum allowable
 93 pressure above 50 kPa relative) of AC switchgear and controlgear with rated voltages above 1 kV up to and
 94 including 52 kV for indoor or outdoor installations. All gases stable and non-corrosive in the conditions that
 95 prevail inside the compartment are covered e.g. gases such as SF₆, compressed air, natural-origin gases,
 96 alternative fluorinated compounds used alone or in gas mixtures with natural origin gases. The gas or gas
 97 mixture being used principally for its dielectric and/or arc-quenching properties.

98 **2 Normative references**

99 The following documents are referred to in the text in such a way that some or all of their content constitutes
 100 requirements of this document. For dated references, only the edition cited applies. For undated references, the
 101 latest edition of the referenced document (including any amendments) applies.

102 EN 62271-1:2017, *High-voltage switchgear and controlgear - Part 1: Common specifications for alternating
 103 current switchgear and controlgear*

104 EN 62271-200, *High-voltage switchgear and controlgear - Part 200: AC metal-enclosed switchgear and
 105 controlgear for rated voltages above 1 kV and up to and including 52 kV*

106 EN ISO 3834 (all parts), *Quality requirements for fusion welding of metallic materials (ISO 3834)*

107 EN ISO 5817, *Welding - Fusion-welded joints in steel, nickel, titanium and their alloys (beam welding excluded)
 108 - Quality levels for imperfections (ISO 5817)*

109 EN ISO 9606 (all parts), *Qualification testing of welders - Fusion welding*

110 EN ISO 14732, *Welding personnel - Qualification testing of welding operators and weld setters for mechanized
 111 and automatic welding of metallic materials (ISO 14732)*

112 **3 Terms and definitions**

113 For the purposes of this document, the following terms and definitions apply.

114 ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- 115 • ISO Online browsing platform: available at <https://www.iso.org/obp>
- 116 • IEC Electropedia: available at <https://www.electropedia.org/>

117 **3.1**118 **compartment**

119 part of gas-insulated metal-enclosed switchgear retaining the insulating gas under the prescribed conditions
 120 necessary to safely maintain the rated insulation level, protecting the equipment against external influences and
 121 providing a high degree of protection to personnel

122 **3.2**123 **manufacturer**

124 individual or body finally responsible for designing and producing the compartment

125 Note 1 to entry: In this document, this is the switchgear manufacturer, even when the compartment is produced by a sub-
 126 manufacturer.

prEN 50187:2021 (E)

127 **3.3**
 128 **design pressure (of a compartment)**
 129 upper limit of the relative pressure between the pressure inside a compartment at the design temperature, under
 130 defined installation conditions, and the pressure outside that compartment, that is used to determine the design
 131 of the compartment

132 Note 1 to entry: The transient pressure occurring during and after a breaking operation (e.g. circuit-breaker) is not
 133 considered in the determination of the design pressure.

134 **3.4**
 135 **design temperature (of a compartment)**
 136 highest average temperature over the compartment, which can be reached by the gas under service conditions

137 Note 1 to entry: Solar radiation should be considered when it has a significant effect on the temperature of the gas and on
 138 the mechanical properties of materials. Similarly, the effects of low temperatures on the properties of some materials should
 139 be considered.

140 **3.5**
 141 **filling pressure (of a compartment)**
 142 pressure in kPa (relative) assigned by the manufacturer referred to atmospheric air conditions of 20 °C and
 143 1 013 hPa at which the gas-filled compartment is filled before being put into service

144 Note 1 to entry: Complete gas filling may be made during manufacturing or at installation site depending on transportation
 145 limitations.

146 **3.6**
 147 **bursting disc**
 148 non-reclosing pressure relief device operated by differential pressure, also known as pressure safety disc,
 149 rupture disk, or burst diaphragm

150 **3.7**
 151 **spring loaded safety valve**
 152 self-closing safety valve which is closed by a spring

153 Note 1 to entry: These safety valves are part of the gas handling equipment and not of the switchgear itself.

154 **3.8**
 155 **integrated pressure relief device**
 156 protective device which intentionally weakened integral parts or areas of the compartment with the functionality
 157 of a bursting disc

4 Normal and special service conditions

159 Unless otherwise specified in this document, the pressurized compartments of metal-enclosed switchgear and
 160 controlgear are designed to be used under normal service conditions according to 4.1 of EN 62271-1:2017.

161 For pressurized compartments of metal-enclosed switchgear and controlgear intended to be used in special
 162 service conditions, 4.2 of EN 62271-1:2017 is applicable.

5 Design and construction**5.1 General**

165 Design of compartments for gas insulated switchgear and controlgear prescribed in this clause considers that
 166 the compartments are subjected to particular operating conditions (see introduction) which distinguish them
 167 from parts for compressed air receivers and similar storage vessels.

168 5.2 Materials

169 Any suitable materials or combination of materials may be used for the manufacturing of compartments. Typical
170 examples are:

- 171 ▪ Wrought mild steel
- 172 ▪ Wrought austenitic stainless steel
- 173 ▪ Wrought aluminium
- 174 ▪ Cast aluminium
- 175 ▪ Cast resin

176 The properties of the materials should be taken from the applicable standards.

177 The material properties shall be verified either by a certificate from the supplier or tests carried out by the
178 switchgear manufacturer.

179 5.3 Corrosion allowance

180 Compartments are normally filled with a thoroughly dried gas or gas mixture that is stable and non-corrosive in
181 the conditions that prevail inside the compartment. For this reason, no internal corrosion allowance is required
182 on the wall thickness of these compartments.

183 5.4 Manholes and inspection openings

184 No manholes or inspection openings are necessary for inspection of the condition of the compartment.

185 5.5 Design pressure

186 The design is based on the design pressure as defined in 3.3.

187 5.6 Design temperature

188 The selection of material and the determination of the design stress depend upon the highest wall temperature
189 which can be expected during service. Thus, the design of a compartment is based on the design temperature
190 as defined in 3.4.

191 5.7 Design

192 5.7.1 General

193 The geometry of a compartment can be determined by electrical rather than mechanical considerations. This
194 constraint can result in a compartment geometry which requires an unacceptable degree of calculation or which
195 cannot be calculated at all. In such a case, a test in accordance with subclause 8.3 is sufficient to verify the
196 design of the pressurized enclosure against pressure increase with a safety margin.

197 When designing a compartment, account shall be taken of the following, if applicable:

- 198 a) The possible evacuation of the compartments as part of the filling process.

199 For enclosures of this type it can be necessary to evacuate the air before introducing gas pressure, this
200 ensures purity of the gas. However, the evacuated condition is not an operational condition, and, in most
201 cases, enclosures are evacuated inside an evacuation chamber with compensated pressure to reduce the
202 stress and possible damages to the enclosure.

- 203 b) The resulting pressure in the event of an accidental leak between compartments having different pressures.

- 204 c) The full differential pressure possible across the compartment wall.

- 205 d) Superimposed loads and vibrations by external effects.

prEN 50187:2021 (E)

206 e) Stresses caused by temperature differences including transient conditions and by differences in coefficients
207 of thermal expansion.

208 f) Effects of solar radiation, when applicable.

209 g) Dynamic stress due to short circuit current.

210 5.7.2 Calculation methods

211 Because of the various shapes, sizes, and materials used it is not possible to design such compartments using
212 equations from conventional pressure vessel codes, therefore established methods should be used, using the
213 design pressure and the design temperature as defined in 3.3 and 3.4.

214 The nominal design strength should be selected from the material standards. For castings the nominal design
215 strength of the material without heat treatment should be used in the heat affected areas of welds. For wrought
216 aluminium parts the nominal design strength in the annealed condition should be used in the design of welded
217 structures.

218 Design stresses can be established either by calculation and/or pressure tests, where tensile stresses are
219 measured at several locations of the enclosure in order to verify the calculation and/or the design.

220 The permissible design stress (f_a) at the design pressure and at the design temperature including the safety
221 factor of the appropriate equations is given by:

$$222 \quad f_a = R_m / 3,0$$

223 where

224 R_m is minimum tensile strength of the material at the design temperature taken from the material standard.

225 3,0 is the safety factor.

226 The calculation may be made on different values of tensile strength if the values are guaranteed by a material
227 certification (metal sheet) or by quality control and testing for moulded pieces, e.g. cast resin composite.

228 6 Manufacturing and workmanship

229 Manufacturing shall be carried out in accordance with proven engineering practice and meet welding quality
230 requirements per the EN ISO 3834 series and EN ISO 5817.

231 Any welding shall be carried out by welders who have successfully carried out welder procedure tests in
232 accordance with the EN ISO 9606 series for manual or partly mechanized welding processes and with
233 EN ISO 14732 for mechanized and automatic welding.

234 Where mechanized and automatic welding are employed, the initial setting of the machine shall be verified for
235 each weld configuration by a test specimen before production commences.

236 Periodically the performance of the equipment shall be verified by an identical test specimen.

237 For cast resin compartments, refer to subclause 8 of prEN 50089:2021.

238 7 Quality assurance

239 The switchgear manufacturer shall be responsible for achieving and maintaining a consistent and adequate
240 quality of product. In this respect, reference to EN ISO 9000 series of standards is appropriate.

241 Enough examinations shall be made by the compartment manufacturer to ensure that the materials, production
242 and testing comply in all respects with the requirements of this document. Inspection by user's inspectors shall
243 not absolve the switchgear manufacturer from this responsibility to exercise such quality assurance procedures
244 as to ensure that the requirements and intent of this document are satisfied.
