ISO/DIS 2560:2019(E)**Foreword**

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 44, *Welding and allied processes*, Subcommittee SC 3, *Welding consumables*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Official interpretations of TC 44 documents, where they exist, are available from this page: <https://committee.iso.org/sites/tc44/home/interpretation.html>.

This fourth edition cancels and replaces the third edition (ISO 2560:2009), which has been technically revised.

The main changes compared to the previous edition are as follows:

- draft updated to latest ISO template and styles, e.g. AC for a.c. and DC for d.c.
- all references updated to latest editions and titles
- Table 3B: alloy symbol “No symbol, -1, -P1 or -P2”, nominal level (% by mass) for Mn is now 1,3
- Table 4B: footnote “d” added to the “All” for symbol 45 to state: “Not including PF (vertical up)”
- Table 5A: Nominal electrode efficiency change to Electrode efficiency
- Table 10B: Maximum Si values have been changed for E4918 and E4918-1, E5516-3M3, E5516-N7
- Table 10B: Maximum Mo for E5516-N3 changed to N.S.

ISO/DIS 2560:2019(E)**Introduction**

This document recognizes that there are two somewhat different approaches in the global market to classifying a given electrode, and allows for either or both to be used, to suit a particular market need. Application of either type of classification designation (or of both, where suitable) identifies a product as classified in accordance with this document. The classification in accordance with system A is mainly based on EN 499:1994. The classification in accordance with system B is mainly based upon standards used around the Pacific Rim.

This Document provides a classification in order to designate covered electrodes in terms of the yield strength, tensile strength and elongation of the all-weld metal. The ratio of yield strength to tensile strength of weld metal is generally higher than that of parent metal. Users should note that matching weld metal yield strength to parent metal yield strength does not necessarily ensure that the weld metal tensile strength matches that of the parent metal. Therefore, where the application requires matching tensile strength, selection of the consumable should be made by reference to column 3 of Table 1A or to Table 1B and Table 8B.

It should be noted that the mechanical properties of all-weld metal test specimens used to classify the electrodes vary from those obtained in production joints because of differences in welding procedure such as electrode size, width of weave, welding position, welding current, interpass temperature and parent metal composition.

iTeh STANDARD PREVIEW
(standards.iteh.ai)

<https://standards.iteh.ai/catalog/standards/sist/adeacdc8-0446-48d3-b8be-2d116776eb87/osist-pre-iso-2560-2019>

Welding consumables — Covered electrodes for manual metal arc welding of non-alloy and fine grain steels — Classification

1 Scope

This document specifies requirements for the classification of covered electrodes and deposited metal in the as-welded condition and in the post-weld heat-treated condition for manual metal arc welding of non-alloy and fine grain steels with a minimum yield strength of up to 500 MPa or a minimum tensile strength of up to 570 MPa.

This document is a combined specification providing for classification utilizing a system based upon the yield strength and the average impact energy of 47 J of all-weld metal, or utilizing a system based upon the tensile strength and the average impact energy of 27 J of all-weld metal.

- a) Clauses, subclauses and tables which carry the suffix letter “A” are applicable only to covered electrodes classified to the system based upon the yield strength and the average impact energy of 47 J of all weld metal in this Document.
- b) Clauses, subclauses and tables which carry the suffix letter “B” are applicable only to covered electrodes classified to the system based upon the tensile strength and the average impact energy of 27 J of all weld metal in this Document.
- c) Clauses, subclauses and tables which do not have either the suffix letter “A” or the suffix letter “B” are applicable to all covered electrodes classified in this Document.

2 Normative references

3 Terms and definitions

No terms and definitions are listed in this document.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

4 Classification

Classification designations are based upon two approaches to indicate the tensile properties and the impact properties of the all-weld metal obtained with a given electrode. The two designation approaches include additional designators for some other classification requirements, but not all, as is clear from the following subclauses. In most cases, a given commercial product can be classified in both systems. Then either or both classification designations can be used for the product.

The classification includes all-weld metal properties obtained with a covered electrode as given below. The classification is based on an electrode size of 4,0 mm, with the exception of the symbol for welding position, which is based on ISO 15792-3. Where the defined diameter has not been manufactured, the closest diameter to 4,0 mm shall be used for all-weld metal tests.

4A Classification by yield strength and 47 J impact energy

The classification is divided into eight parts:

- 1) the first part gives a symbol indicating the product/process to be identified;
- 2) the second part gives a symbol indicating the strength and elongation of all-weld metal (see Table 1A);
- 3) the third part gives a symbol indicating the impact properties of all-weld metal (see Table 2A);
- 4) the fourth part gives a symbol indicating the chemical composition of all-weld metal (see Table 3A);
- 5) the fifth part gives a symbol indicating the type of electrode covering (see 5.5A);
- 6) the sixth part gives a symbol indicating the nominal electrode efficiency and type of current (see Table 5A);
- 7) the seventh part gives a symbol indicating the welding position (see Table 6A);
- 8) the eighth part gives a symbol indicating the diffusible hydrogen content of the deposited metal (see Table 7).

In order to promote the use of this Document, the classification is split into two sections:

a) Compulsory section

This section includes the symbols for the type of product, the strength and elongation, the impact properties, the chemical composition and the type of covering, i.e. the symbols defined in 5.1, 5.2A, 5.3A, 5.4A and 5.5A.

b) Optional section

This section includes the symbols for the nominal electrode efficiency, the type of current, the welding positions for which the electrode is suitable, and the symbol for diffusible hydrogen content, i.e. the symbols defined in 5.7A, 5.8A and 5.9.

The designation (see Clause 12), compulsory section and any chosen elements of the optional section, shall be used on packages and in the manufacturer's literature and data sheets. See Figure A.1 for a schematic representation of the full designation of electrodes classified by yield strength and 47 J impact energy (system A). See Figure A.2 for a schematic representation of the full designation of electrodes classified by tensile strength and 27 J impact energy (system B).

4B Classification by tensile strength and 27 J impact energy

The classification is divided into seven parts:

- 1) the first part gives a symbol indicating the product/process to be identified;
- 2) the second part gives a symbol indicating the strength of all-weld metal (see Table 1B);
- 3) the third part gives a symbol indicating the type of electrode covering, the type of current, and the welding position (see Table 4B);
- 4) the fourth part gives a symbol indicating the chemical composition of all-weld metal (see Table 3B);
- 5) the fifth part gives a symbol indicating the condition of post-weld heat treatment under which the all-weld metal test was conducted (see 5.6B);
- 6) the sixth part gives a symbol indicating that the electrode has satisfied a requirement for 47 J impact energy at the temperature normally used for the 27 J requirement;
- 7) the seventh part gives a symbol indicating the diffusible hydrogen content of the deposited metal (see Table 7).

In order to promote the use of this Document, the classification is split into two sections:

a) Compulsory section

This section includes the symbols for the type of product, the strength, the type of covering, the type of current, the welding position, the chemical composition and the condition of heat treatment, i.e. the symbols defined in 5.1, 5.2B, 5.4B, 5.5B and 5.6B.

b) Optional section

This section includes the symbol for the optional supplemental designator for 47 J impact energy, i.e. the symbol defined in 5.3B; and the symbol for diffusible hydrogen content, i.e., the symbol defined in 5.9.
