

Designation: F833 – 09

Standard Consumer Safety Performance Specification for Carriages and Strollers¹

This standard is issued under the fixed designation F833; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

INTRODUCTION

This consumer safety performance specification addresses carriage and stroller incidents that were identified by the U.S. Consumer Product Safety Commission (CPSC).

The CPSC identified injuries to children associated with the following: stability, brakes, restraint systems, latches and folding mechanisms, structural integrity, and deaths due to entrapment in openings of convertible carriage/strollers. By far, the most common injury resulted when a child fell or climbed out of a stroller because the restraint system was not being used. In response to the incidents data developed by the CPSC, this consumer safety performance specification attempts to minimize the previously listed problems. This specification does not cover carriages and strollers that are blatantly misused, although warnings and safety instructions are required to be prominently displayed on or with each carriage or stroller.

NOTE 1—This consumer safety performance specification is not intended to address incidents and injuries resulting from the interaction of other persons with children in carriages or strollers or incidents resulting from unforeseeable abuse or misuse.

This consumer safety performance specification is written within the current state of the art of carriage and stroller technology. It is intended that this specification will be updated whenever substantive information becomes available which necessitates additional requirements or justifies the revision of existing requirements.

1. Scope

1.1 This consumer safety specification establishes safety performance requirements, test methods, and labeling requirements to minimize the hazards to children presented by carriages and strollers as identified in the introduction. Children's products such as tricycles, bicycles or other similar wheeled products that can be self-propelled by a child are not considered carriages or strollers subject to the requirements of this standard, even if the item has a temporary or permanent handle.

1.2 No carriage or stroller produced after the approval date of this consumer safety performance specification shall, either by label or other means, indicate compliance with this specification unless it conforms to all requirements herein.

1.3 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.4 The following precautionary caveat pertains only to the test method portion, Section 7, of this consumer safety specification: *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

3.1.1 *carriage, n*—wheeled vehicle generally used for the transport of an infant who is generally in a lying down position. The motive power is supplied by a person or persons pushing or pulling on a handle attached to the vehicle. A carriage may be capable of being folded for storage.

3.1.2 *conspicuous, n*—label that is visible, when the unit is in a manufacturer’s recommended use position, to a person standing near the unit at any one position around the unit but not necessarily visible from all positions.

3.1.3 *convertible carriage/stroller, n*—wheeled vehicle that is intended to be converted by the owner to be used as either a carriage or a stroller.

3.1.4 *harness system, n*—shall include a waist and crotch restraint and a means of restraining the upper torso.

3.1.5 *infant, n*—young child who is not capable of sitting unassisted.

3.1.6 *jogging stroller, n*—stroller intended to be used for children at a jogging rate (run at a steady slow trot).

3.1.7 *manufacturer’s recommended use position, n*—any position that is presented as a normal, allowable, or acceptable configuration for use of the product by the manufacturer in any descriptive or instructional literature. This specifically excludes positions that the manufacturer shows in a like manner in its literature to be unacceptable, unsafe, or not recommended.

3.1.8 *non-paper label, n*—any label material (such as plastic or metal) that either will not tear without the aid of tools or tears leaving a sharply defined edge.

3.1.9 *occupant(s), n*—that individual or those individuals who are in a product that is set up in one of the manufacturer’s recommended use positions.

3.1.10 *occupant retention space, n*—space enclosed by the surfaces, for example, side walls or the floor, or both, of a carriage or convertible carriage/stroller that contains the occupant within a carriage or a stroller in the reclined carriage position.

3.1.11 *paper label, n*—any label material that tears without the aid of tools and leaves a fibrous edge.

3.1.12 *reclined carriage position, n*—adjustment position of a convertible carriage/stroller that allows for an interior angle of greater than 150° between the seat surface and the backrest.

3.1.13 *static load, n*—vertically downward force applied by a calibrated force gage or by dead weights.

FIG. 1 Stroller With Hinged Link

3.1.14 *stroller, n*—wheeled vehicle for the transport of infants or children generally in a sitting-up or semi-reclined position. The motive power is supplied by a person moving at a walking rate while pushing on a handle attached to the stroller. A stroller generally is capable of being folded for storage. Strollers normally are used for children from infancy to 36 months of age.

4. Calibration and Standardization

4.1 All testing shall be conducted on a concrete floor that shall be covered with 1/8-in. (3-mm) thick vinyl floor covering, unless test instructs differently.

4.2 The unit shall be completely assembled, unless otherwise noted, in accordance with the manufacturer’s instructions.

4.3 No testing shall be conducted within 48 h of manufacturing.

4.4 The product to be tested shall be in a room with an ambient temperature of 73 ± 9°F (23 ± 5°C) for at least 1 h prior to testing. Testing shall then be conducted within this temperature range.

4.5 All testing required by this specification shall be conducted on the same unit.

5. General Requirements

5.1 There shall be no hazardous points or edges as defined by 16 CFR 1500.48 and 16 CFR 1500.49 before and after testing to this consumer safety specification.

5.2 There shall be no small parts as defined by 16 CFR 1501 before testing or liberated as a result of testing to this specification.

5.3 The paint and surface-coating on the product shall comply to 16 CFR 1303.

5.4 Prior to testing, any exposed wood parts shall be smooth and free of splinters.

5.5 *Latching Mechanisms*—Any unit that folds shall have a latching device or other provision in the design that will prevent the unit from unintentional folding when properly placed in the manufacturer’s recommended use position. Products with latching devices for prevention of unintentional folding shall be tested in accordance with 7.2. During and upon completion of this test, the unit shall remain latched in its manufacturer’s recommended use position.

5.5.1 Strollers that employ hinged links with a geometric over center action (see Fig. 1) to maintain the product in the

FIG. 2 Opening Example.

normal use position shall require two distinct and separate actions on the part of the user to initiate folding of the product. Such strollers shall require only a single action on the part of the user to secure the stroller in the normal use position.

5.6 *Openings*—Holes or slots that extend entirely through a wall section of any rigid material less than 0.375 in. (9.53 mm) thick and admit a 0.210-in. (5.33-mm) diameter rod shall also admit a 0.375-in. (9.53-mm) diameter rod. Holes or slots that are between 0.210 in. (5.33 mm) and 0.375 in. (9.53 mm) and have a wall thickness less than 0.375 in. (9.53 mm) but are limited in depth to 0.375 in. (9.53 mm) maximum by another rigid surface shall be permissible (see Fig. 2). The product shall be evaluated in all manufacturer’s recommended use positions.

5.7 *Scissoring, Shearing, Pinching*—The unit, when in the manufacturer’s recommended use position, shall be designed and constructed so as to prevent injury to the occupant from any scissoring, shearing, or pinching when members or components rotate about a common axis or fastening point, slide, pivot, fold, or otherwise move relative to one another. Scissoring, shearing, or pinching that may cause injury shall not be permissible when the edges of the rigid parts admit a probe greater than 0.210-in. (5.33-mm) diameter and less than 0.375-in. (9.53-mm) diameter at any accessible point throughout the range of motion of such parts. This excludes the adjustment of accessory items such as canopies, storage latches, baskets, etc.

5.8 *Exposed Coil Springs*—Any exposed coil spring which is accessible to the occupant, having or capable of generating

a space between coils of 0.210 in. (5.33 mm) or greater during static load testing (see 6.2 and 7.3) shall be covered or otherwise designed to prevent injury from entrapment.

5.9 *Labeling*:

5.9.1 Warning labels (whether paper or non-paper) shall be permanent when tested in accordance with 7.8.1-7.8.3.

5.9.2 Warning statements applied directly onto the surface of the product by hot stamping, heat transfer, printing, wood burning, etc. shall be permanent when tested in accordance with 7.8.4.

5.9.3 Non-paper labels shall not liberate small parts when tested in accordance with 7.8.5.

5.10 *Protective Components*—If a child can grasp components between the thumb and forefinger, or teeth, such as caps, sleeves, or plugs used for protection from sharp edges, points, or entrapment of fingers or toes, or if there is at least a 0.040-in. (1.00-mm) gap between the component and its adjacent parent component, such component shall not be removed when tested in accordance with 7.9.

5.11 *Seat Recline Measurement*—Place the back of the stroller in the most reclined position. Place the hinged boards with the hinged edge into the junction of the stroller back and seat (see Fig. 3). Measure the angle between the two boards.

5.12 *Toy*—Toy accessories attached to, removable from, or sold with unit, as well as their means of attachment, shall meet applicable requirements of Consumer Safety Specification F963.

6. Performance Requirements

NOTE 1—The forces that are to be applied to the sample in the test methods described in Section 7 of this specification are applied readily by means of a calibrated force gage, or in the case of static load and dynamic load test methods, by dead weights.

6.1 *Brake Requirements*—A braking device shall be provided on the unit. The braking device shall remain engaged and prevent the braked wheel(s) from rotating more than 90° during the test described in 7.6. The brake shall be constructed so that it can not be disengaged by the child within the unit when the child is secured in the unit in accordance with the instructional literature.

6.2 *Static Load*:

6.2.1 A carriage shall support a static load of 50 lbf (222 N) when placed in the approximate center of the area intended to support the infant occupant.

6.2.2 A stroller shall support a static load of 100 lb (45.4 kg) or 2.5 times the manufacturer’s recommended maximum weight, whichever is greater, per individual seating area, when placed in the approximate center of the area intended to support the child occupant.

6.2.3 A convertible carriage/stroller shall support a static load appropriate to the configuration in which the unit is erected. All configurations shall be tested.

6.2.4 A combination unit of a car seat on a stroller shall support a static load of 50 lbf (222 N) when placed in the approximate center of the area intended to support the occupant.

6.2.5 Test methods shall be performed in accordance with 7.3. At the conclusion of the test method, there shall be no unacceptable conditions as identified within this specification

NOTE— $\frac{3}{4}$ in. (19 mm) by 6 in. (150 mm) by 6 in. (150 mm) board hinged to a $\frac{3}{4}$ in. (19 mm) by 6 in. (150 mm) by 9 in. (225 mm) board placed in the junction of the stroller seat.

FIG. 3 Seat Back Recline Board

(see Note 2). In cases of multiple occupancy units, a specified test weight shall be applied simultaneously to each occupant position.

NOTE 2—For the purpose of this specification, the unacceptable conditions that might be identified by the static load test methods shall be tip over, collapse of the product or a component of the product, sharp edges or points, and small parts.

6.3 *Stability*—The product shall remain on the appropriate test plane and not tip over when tested in accordance with 7.4. At the end of this test method, the unit shall remain in the manufacturer's recommended-use position on the inclined test plane when tested in accordance with 7.4.1 and on a horizontal test plane when tested in accordance with 7.4.2. In cases of multiple-occupancy units, the specified test weight shall be placed in any occupant seat deemed to be the worst or the most likely to fail. Products that include as original equipment manufacturer-supplied accessories for carrying any type of packages must be tested with these accessories both empty and loaded with the most adverse configured combination of weights, including the maximum weight(s) specified by the manufacturer, while each available seating position is occupied by the specified test weight.

6.4 *Restraining System*—All products covered by this specification, except carriages designed only for an infant, must have a child restraint system. The manufacturer shall attach the restraint system in such a manner that it will not become detached through normal usage. The restraint system shall include both waist and crotch restraint. The crotch restraint shall be designed such that its use is mandatory when the restraint system is in use.

6.4.1 *Carriage*—No restraining system is required if the carriage is intended to be used for an infant only. Carriages with accessory sit-up backs or other items indicating intent to be used for children developed beyond infancy must have a restraining system (see 6.4.4).

6.4.2 *Stroller*—A restraining system shall be provided pre-assembled by the manufacturer to a component of the stroller.

6.4.3 *Convertible Carriage/Stroller*—A restraining system shall be provided on each convertible carriage/stroller that will function as though the unit is specifically a carriage (see 6.4.1) or stroller (see 6.4.2).

6.4.4 *Restraining System*—Test methods for all restraining systems shall be in accordance with 7.5. The closing mechanisms shall not part or slip more than 1 in. (25 mm). The anchorages shall not separate from their attachment points. At the end of the tests, the CAMI dummy shall not be released fully. When tested in accordance with 7.5.2.8, the restraint system (see Fig. 4 for Point C) shall not move more than 2 in. (51 mm).

6.4.5 *Harness System*—If a harness system utilizes seat back anchor points for shoulder straps, then the system shall meet the requirements of 7.5.3.

6.4.6 *Location of Restraining System*—When tested in accordance with 7.5.4, the restraining system shall meet the following requirements.

6.4.6.1 The anchor points of the waist restraint shall be between the 2-in. (50-mm) line and the 5-in. (127-mm) line on the test cylinder when tested in accordance with 7.5.4.3. (See Fig. 5.)

FIG. 4 Restraint System Setup

FIG. 5 Thigh Depth, Seated

6.4.6.2 A 1-in. (25-mm) diameter probe shall not freely pass through any gap between the waist restraint and the test cylinder when tested in accordance with 7.5.4.4.

6.4.6.3 The location of the crotch anchor shall not be in front of the test cylinder when tested in accordance with 7.5.4.5.

6.4.6.4 The point on the lower edge of the waist strap shall be between the 4.5-in. (114-mm) line and the 7.5-in. (190-mm) line on the test cylinder when tested in accordance with 7.5.4.6.

6.5 Occupant Retention—Carriages or seating locations of convertible carriage/strollers with a reclined carriage position(s) shall have a wall(s) surrounding all sides above the floor of the occupant retention space. The enclosure shall not allow the complete passage of the test probe shown in Fig. 6 through any completely bounded external openings (any holes) below the top edge of the occupant retention space when tested in accordance with 7.7.

6.5.1 Products with a reclined carriage position(s) must have a nondetachable feature to enable them to conform to the requirement in 6.5 unless the product only can be adjusted to any reclined carriage position when a detachable device is attached.

6.5.1.1 Nondetachable denotes that the occupant retention assembly cannot be separated or removed from the product without damaging it or be removed without the aid of tools.

6.6 Combination Unit of a Car Seat on a Stroller—The combined unit shall conform to the requirements of 2.2, 5.5 in accordance with 7.2, 6.1 in accordance with 7.6, 6.2.4 in accordance with 7.3.2, 6.3 in accordance with 7.4.1, 7.10, and 9.1 in all manufacturer’s recommended use positions. When testing the combination unit according to 7.10 (16 CFR 1500.52 (b) (4) (iii)), the unit shall neither have any broken parts nor allow the car seat to completely separate from the stroller.

6.7 Impact Test:

6.7.1 For combination unit of a car seat on a carriage, stroller, or convertible carriage/stroller:

6.7.1.1 The unit shall not allow the car seat to completely separate from the stroller when tested in accordance with 7.11.2-7.11.6.

6.7.2 For carriage, stroller, or convertible carriage/stroller:

6.7.2.1 The fold locking/latching mechanism shall not disengage or break, or both, and breakage shall not occur to the frame of the unit when tested in accordance with 7.11.7.

6.8 Passive Containment/Foot Opening—The test shall be performed on all strollers and convertible carriage/strollers that have a tray(s) or grab bar(s) that create a completely or partial bounded opening(s) in front of the occupant. An opening(s) shall either permit complete passage of the head probe (Fig. 7) when tested in accordance with 7.12.2 or shall not permit complete passage of the torso probe (Fig. 8) when tested in accordance with 7.12.4.

7. Test Methods

7.1 If during the course of conducting the test methods in this safety specification, a test model suffers any permanent deformation or damage, an additional test model of the same model shall be used for the remainder of the test methods.

7.2 Latching Mechanisms for Prevention of Unintentional Folding:

MATERIAL: SMOOTH FINISH PLASTIC OR METAL
FIG. 6 Occupant Retention Probe

8.0-in. (200-mm) hollow sphere
 Material: ABS
 Weight: 5 lb (2.3 kg)

FIG. 7 Head Probe

NOTE—Not to scale.
FIG. 8 Torso Probe

7.2.1 Erect the product in accordance with the manufacturer's instructions, and gradually place a 5-lb (2.3-kg) weight (similar to a 5-lb bag of sugar) in the center of the supporting surface.

7.2.2 Place the product in the manufacturer's recommended use position so that the normal folding motion is not impeded.

7.2.3 Apply a force of 45 lbf (200 N) at the location normally associated with the folding action and in the direction normally associated with folding the product in accordance with the manufacturer's instructions. Gradually apply the force within 5 s and maintain for an additional 10 s.

NOTE 3—Do not apply this force on latching or unlatching means itself.

7.2.4 Repeat 7.2.3 for a total of 5 times within 2 min.

7.2.5 Fold the unit in accordance with the manufacturer's instructions and repeat 7.2.1, 7.2.2, and 7.2.3 one additional time.

7.3 Static Load Test Method:

7.3.1 Place the product in the manufacturer's recommended use position.

7.3.2 Place the specified weight from 6.2 upon a 6 by 6-in. (150 by 150-mm) wood block 3/4 in. (19 mm) thick in the unit at the location called for in 6.2. If the unit has a hammock-type seat, use a standard 6-in. weld cap as identified in Fig. 9 instead of the specified wood block upon which to place the test weight. Make allowances for the mass of the weld cap. Gradually apply the weight within 5 s and maintain for an additional 60 s.

7.3.3 Place a 50-lb (22.7-kg) weight or 1.25 times the manufacturer's recommended maximum weight of an individual seating area, whichever is greater, upon the center of
