English version

Fixed time cybersecurity evaluation methodology for ICT products

Méthode d'évaluation de la cybersécurité pour produits TIC

Cybersicherheitsevaluationsmethodologie für IKT-Produkte

This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/CLC/JTC 13.

If this draft becomes a European Standard, CEN and CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

iTeh STANDARD PREVIEW

This draft European Standard was established by CEN and CENELEC in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN and CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN and CENELEC members are the national standards bodies and national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation. Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

This document (prEN 17640:2021) has been prepared by Technical Committee CEN/JTC 13 “Cybersecurity and Data Protection”, the secretariat of which is held by DIN.

This document is currently submitted to the CEN Enquiry.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[oSIST prEN 17640:2021](https://standards.iteh.ai/catalog/standards/sist/1db2b795-8c7f-4836-a3b1-772d9528da8b/osist-pren-17640-2021)

<https://standards.iteh.ai/catalog/standards/sist/1db2b795-8c7f-4836-a3b1-772d9528da8b/osist-pren-17640-2021>

Introduction

The foundation for a sound product certification is a reliable, transparent and repeatable evaluation methodology. Several product or scheme dependent evaluation methodologies exist, however, in the advent of the CSA [1] new schemes need new methodologies to evaluate the cybersecurity functionalities of products. These new methodologies are required to describe evaluation tasks defined in the CSA (e.g. Technical Documentation Review, Check Against Known Vulnerabilities). In addition, existing cybersecurity evaluation methodologies (e.g. EN ISO/IEC 15408 and EN ISO/IEC 18045) are not designed to be used in a fixed time, i.e. the duration of the evaluation can be extended considerable during execution.

The CSA enables scheme developers to consider self-assessment as well as third party evaluations. The self-assessment may be performed at assurance level “basic”, the third-party evaluations at assurance level “basic”, “substantial” or “high”. And, depending on the requirements of the individual scheme, the evaluation criteria and methodology might be subject to extra tailoring. This cybersecurity evaluation methodology caters for all of these needs. This methodology has been designed so that it can (and needs to be) adapted to the requirements of each scheme.

Scheme developers are encouraged to implement the evaluation methodology for the intended use of the scheme, applicable for general purpose or in dedicated (vertical) domains, by selecting those aspects needed for self-assessment at level “basic” or third party evaluation at any level required by the scheme.

This document provides the minimal set of evaluation activities defined in the CSA to achieve the desired assurance level as well as optional tasks, which might be required by the scheme. Selection of the various optional tasks is accompanied by guidelines so scheme developers can estimate the impact of their choices. Further adaption to the risk situation in the scheme can be achieved by choosing the different evaluation tasks defined in the methodology or using the parameters of the evaluation tasks, e.g. the number of days for performing certain tasks.

If scheme developers choose tasks that are not defined in this evaluation methodology, it will be responsibility of the scheme developer to define a set of companion requirements or re-use an applicable evaluation methodology.

Nonetheless, it is expected that individual schemes will instantiate the general requirements laid out in this evaluation methodology and provide extensive guidance for manufacturers (and all other parties) about the concrete requirements to be fulfilled within the scheme.

Evaluators, testers and certifiers can use this methodology to conduct the assessment, testing or evaluation of the products and to perform the actual evaluation/certification according to the requirements set up by a given scheme. It also contains requirements for the level of skills and knowledge of the evaluators/testers and thus will also be used by **accreditation bodies** or **National Cybersecurity Certification Authorities** during accreditation or authorization, where appropriate, and monitoring of conformity assessment bodies.

Manufacturers and developers will find the generic type of evidence required by each evaluation task listed in the evaluation methodology to prepare for the assessment or evaluation. The evidence and evaluation tasks are independent from the fact of whether the evaluation is done by the manufacturer/developer (i.e. first party) or by some else (2nd/3rd party).

Users of certified products (regulators, user associations, governments, companies, consumers, etc.) may also use this document to inform themselves about the assurance drawn from certain certificates using this evaluation methodology. Again, it is expected that scheme developers provide additional information, tailored to the domain of the scheme, about the assurance obtained by evaluations / assessments under this methodology.

Furthermore, this methodology is intended to enable scheme developers to create schemes which attempt to reduce the burden on the manufacturer as much as possible (implying additional burden on the evaluation lab and the certification body).

NOTE In this document the term “Conformity Assessment body” (CAB) is used for CABs doing the evaluation. Other possible roles for CABs are not considered in this document.

It should be noted that this document cannot be used “stand alone”. Each domain (scheme) needs to provide domain specific cybersecurity requirements for the objects to be evaluated / certified. This methodology is intended to be used in conjunction with specifications containing such cybersecurity requirements.

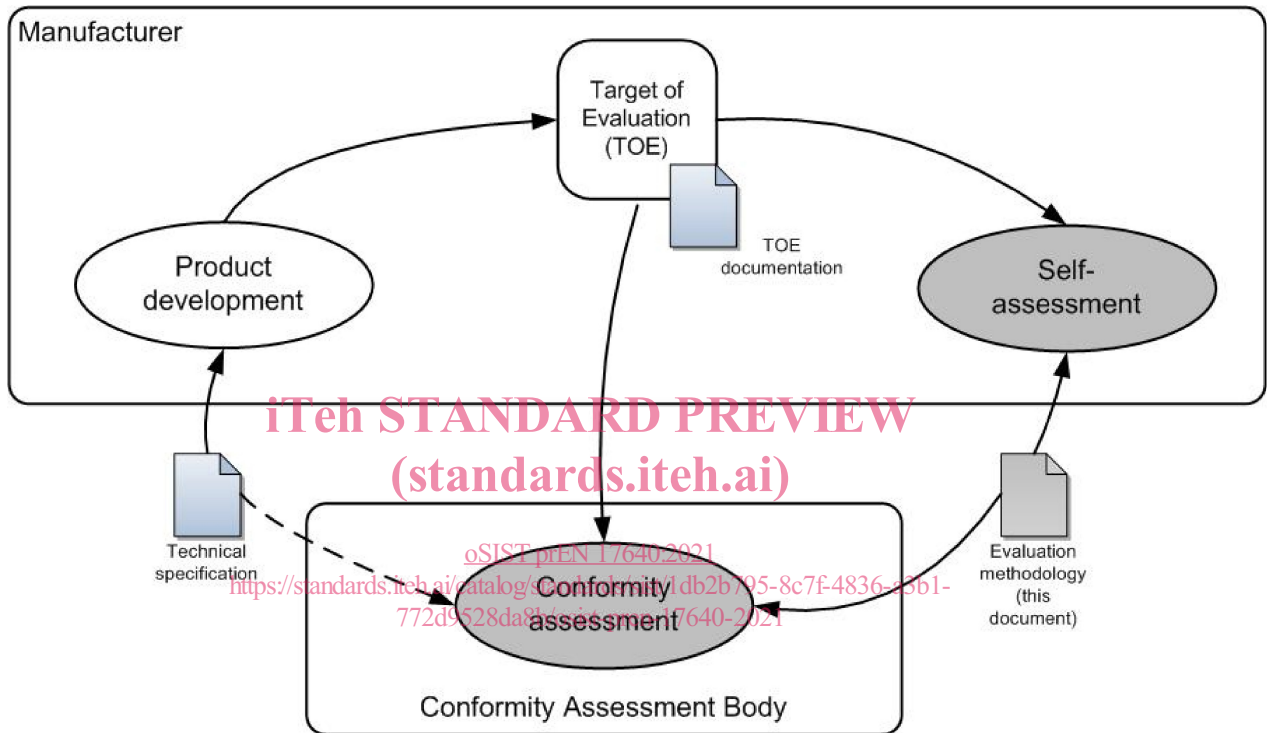

Figure 1 — Relationship of this document to the activities in product conformity assessment

prEN 17640:2021 (E)**1 Scope**

This document describes a cybersecurity evaluation methodology that can be implemented using pre-defined time and workload resources, for ICT products. It is intended to be applicable for all three assurance levels defined in the CSA (i.e. basic, substantial and high).

The methodology comprises different evaluation blocks including assessment activities that comply with the evaluation requirements of the CSA for the mentioned three assurance levels.

Where appropriate, it can be applied both to 3rd party evaluation and self-assessment.

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <https://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

3.1 confirm

<evaluation verb> declare that something has been reviewed in detail with an independent determination of sufficiency

[SOURCE: EN ISO/IEC 15408-1:2009, definition 3.1.4 with NOTE removed]

3.2 certifying function

people or group of people responsible for deciding upon certification

Note 1 to entry: Depending on the scheme the certifying function may use evidence beyond the ETR as basis for the certification decision.

3.3 determine

<evaluation verb> affirm a particular conclusion based on independent analysis with the objective of reaching a particular conclusion

Note 1 to entry: The usage of this term implies a truly independent analysis, usually in the absence of any previous analysis having been performed. Compare with the terms “confirm” or “verify” which imply that an analysis has already been performed which needs to be reviewed.

[SOURCE: EN ISO/IEC 15408-1:2009, definition 3.1.22]

3.4 evaluation task parameter

parameter required to be set when using this document to define how the evaluation task shall be executed by the evaluator

3.5**Evaluation Technical Report (ETR)**

documented information describing the results of the evaluation

3.6**evaluator**

individual that performs an evaluation

3.7**ICT product**

product with information and/or communication technology

3.8**knowledge**

facts, information, truths, principles or understanding acquired through experience or education

Note 1 to entry: An example of knowledge is the ability to describe the various parts of an information assurance standard.

[SOURCE: ISO/IEC TS 17027:2014, 2.56, modified — Note 1 to entry has been added from ISO/IEC 19896-1:2018]

3.9**Protection Profile (PP)**

implementation-independent statement of security needs for a *TOE* (4.16) type

[SOURCE: ISO/IEC EN 15408:2009, definition 3.1.52]

3.10**scheme developer**

person or organization responsible of a conformity assessment scheme

Note 1 to entry: For schemes developed under the umbrella of the CSA the so called “ad hoc group” helps the scheme developer.

Note 2 to entry: This definition is based on and aligned with the definition of “scheme owner” in EN ISO/IEC 17000.

3.11**scheme-specific checklist**

list of items defining the required level of detail and granularity of the documentation, specified by the scheme

3.12**secure state**

state in which all data related to the *TOE* security functionality are correct, and security functionality remains in place

3.13**Secure User Guide**

documented information describing the steps necessary to set up the *TOE* (4.16) into the intended secure state

prEN 17640:2021 (E)**3.14****Security Target (ST)**

documented information describing the security properties and the operational environment of the *TOE* (4.16)

Note 1 to entry: The ST may have different content, structure and size depending on the CSA level.

3.15**self-assessment**

conformance assessment activity that is performed by the person or organization that provides or that is the object of conformity assessment

[SOURCE: EN ISO/IEC 17000:2020, definition 4.3 with NOTES and EXAMPLES removed]

3.16**Target of Evaluation (TOE)**

product (or parts thereof, if product is not fully evaluated) with a clear boundary, which is subject to the evaluation

3.17**verify**

<evaluation verb> rigorously review in detail with an independent determination of sufficiency

Note 1 to entry: Also see “confirm”. This term has more rigorous connotations. The term “verify” is used in the context of evaluator actions where an independent effort is required of the evaluator.

[SOURCE: EN ISO/IEC 15408-1:2009, definition 3.1.84]

4 Conformance

<https://standards.iteh.ai/catalog/standards/sist/1db2b795-8c7f-4836-a3b1-772d9528da8b/osist-pren-17640-2021>

The following Table 1 provides a reference on how the evaluation tasks should be chosen for a certain scheme for the different CSA assurance levels:

Table 1 —Evaluation tasks vs. CSA level conformance claim

Evaluation tasks	CSA level conformance claim		
	Basic	Substantial	High
Completeness check	Shall	Shall	Shall
Protection Profile Evaluation	N/A	N/A	N/A
Review of security functionalities	Shall		
Security Target Evaluation		Shall	Shall
Development documentation	Shall	Shall	Shall
Evaluation of TOE Installation	Should	Shall	Shall

	CSA level conformance claim		
Conformance Testing	Should	Shall	Shall
Vulnerability review	Should	Shall (or done with Clause 6.9)	Shall (or done with Clause 6.9)
Vulnerability testing		Should	Should
Penetration testing			Shall
Basic crypto analysis	Should	Should	
Extended crypto analysis			Should

NOTE 1 Protection Profile Evaluation is a dedicated process not part of an evaluation of a TOE. While the PP specifies for which CSA level it is applicable, the evaluation of a PP is agnostic to this.

NOTE 2 “Shall” means that the CSA is requesting this evaluation task for a certain assurance level or it is necessary to implement the scheme using this evaluation methodology. “Should” means that it is recommended to select the evaluation task but it is not mandatory.

To implement the methodology for a certain scheme, the following steps shall be performed:

1. The scheme developer needs to perform a risk assessment, reviewing the domain under consideration.
2. The scheme developer shall assign the Attack Potential (cf. Clause 5.4 and Annex F) to each CSA assurance level used in the scheme.
3. For each CSA level the scheme developer shall select those evaluation tasks required for this level, these are marked grey in Table 1.
4. For each task chosen, the scheme developers shall review the parameters for this evaluation task and set them suitably based on the risk assessment and the determined attack potential.
5. For each CSA level the scheme developer shall review if those evaluation tasks are sufficient for the scheme based on the determined Attack Potential. If not, the scheme developer shall select additional evaluation tasks [e.g. from the same level], tasks from higher level or additional tasks not defined in this methodology. This might replace tasks already chosen.
6. For each new or updated task chosen the scheme developers shall review the parameters for this task and set them suitably based on the risk assessment and the attack potential.

If the scheme wants to include development process evaluation/assessment, there is an additional task for the scheme: The scheme developer needs to decide about validity of process evaluation/assessment results into future product evaluations. This means that the development related tasks may be performed once, and the output of these tasks is used in several product evaluations (e.g. as a precondition). Optionally the auditors may define a list of artefacts which are to be provided in each subsequent product evaluation, to show that the audited processes are still operational.

If schemes intend to include this development process evaluation/assessment re-use mechanism, they shall ensure that reuse is limited to cases where the development process is the same in all evaluations or assessments, i.e. the site(s), the knowledge of the people and the actual processes are identical or equivalent. To achieve this, the initial evaluation or assessment may be made more broadly (i.e. cover a

prEN 17640:2021 (E)

larger scope of the development). Additionally, the scheme shall limit the maximum period of time during which the results are to be acceptable.

EXAMPLE A usual maximal age of these results is 2 years. This means, if the evaluation / assessment occurs more than two years after the results of the development process evaluation have been produced, the development process needs to be re-assessed/re-evaluated.

For some evaluation tasks the scheme may require additional inputs from the developer, e.g. an architectural overview. This additional input should be limited as much as possible, especially if this documentation is typically only prepared for the assessment or evaluation, i.e. not readily available for the TOE anyhow.

NOTE 3 Requiring design information might preclude some products from assessment or certification, as this information might not be available due to the fact that some third-party components, including hardware, might be proprietary without the possibility to obtain this design information. This is in general not applicable if white box testing is performed (if this is an option in the scheme). Further composition of certified parts is an option to mitigate this problem.

An example is given in Annex D.

5 General concepts

5.1 Usage of this methodology

Clause 5 describes elements of an evaluation methodology for fixed-time security certification and self-assessment.

To instantiate an specific evaluation methodology based on this generic methodology, the required evaluation tasks are selected depending on the intended assurance level according to the CSA. Depending on the domain, certain evaluation tasks are required, while others are optional (see Clause 2 of this document). For sample-based evaluation tasks, the scheme needs to devise the sample size and sampling strategy as well as the absolute or relative weight, i.e. the number of man days or the percentage of overall evaluation time. Additional constraints on sampling might be provided, e.g. on the limits of sampling depending on the CSA level.

To use this methodology, it is not necessary to require all evaluation tasks described in Clause 6 for every assurance level. For example, a scheme designed for CSA assurance level “substantial” might require a “Basic crypto analysis” evaluation task or might omit it and possibly integrate the necessary parts into the “Conformance testing” task instead.

NOTE This document and the resulting scheme do not define the exact structure of the documents used or produced by the evaluation, e.g. the ST or the ETR. These are scheme dependent.

5.2 Knowledge of the TOE

The scheme will require different sets of information or information with different levels of detail. This depends on the one hand on the assurance required, on the other hand additional information might speed up certain evaluation tasks.

In general, the developer shall provide a Security Target and a Secure User Guide. The later may be unnecessary, if the TOE goes into the desired state automatically, i.e. no further guidance is necessary.

The scheme may require additional information for certain activities. This is indicated in the respective evaluation tasks where applicable.

The evaluator shall have access to information (like standards, protocol specifications) regarding the technology implemented in the TOE, where this information is publicly available.

NOTE Publicly available does not imply that it is available free of charge.

5.3 Development process evaluation

This methodology is concerned with ICT product evaluation, and a scheme might limit its evaluation tasks to pure ICT product related activities. However, experience in ICT product certification has shown, that it is sensible and valuable to evaluate the development process as well. This concerns both the initial development (e.g. regarding security during design and construction of the product, including site security) as well as aspects beyond delivery of the product, e.g. vulnerability and update management processes. To improve usage of audit results in future product evaluations, the auditor may define a set of artefacts (e.g. meeting reports, listing of configuration management systems, filled in checklists) which will then be requested in every subsequent product evaluation to verify that the processes audited have been adhered to in this instance.

Generic standards for development process evaluations should be reused where possible, applicable or available.

5.4 Attack Potential

To determine the necessary evaluation tasks and their parameters it is necessary to define the expected threat agent, characterized with a specific strength, also called Attack Potential. The vulnerability analysis task of the evaluator may include penetration testing assuming the Attack Potential of the threat agent. The following levels of Attack Potential are assumed in this document, the categorization is based on [2] and [5]:

- Basic
- Enhanced Basic
- Moderate
- High

iTeh STANDARD PREVIEW
(standards.iteh.ai)

[oSIST prEN 17640:2021
https://standards.iteh.ai/catalog/standards/sist/1db2b795-8c7f-4836-a3b1-772d9528da8b/osist-pr-en-17640-2021](https://standards.iteh.ai/catalog/standards/sist/1db2b795-8c7f-4836-a3b1-772d9528da8b/osist-pr-en-17640-2021)

NOTE Attack Potential Moderate and High are unlikely to be addressable in a fixed-time evaluation scheme: systematic availability of detailed documentation will probably be necessary to be allow evaluators to be on par with high level threat agents.

The CSA [1] defines three assurance levels: basic, substantial and high. Each level has an implicitly defined attack scenario assigned. Scheme developers are advised to review the definitions in the CSA to align the CSA assurance levels (as applicable to their domain) with the attack potential used in this methodology.

In the end evaluators will assess whether a threat agent possessing a given Attack Potential is able to bypass or break the security functionality of the TOE.

The calculation of the attack potential is given in Annex F.

5.5 Knowledge building

Ensuring that each evaluation task produces the expected results requires certain knowledge and competence by the evaluators. This knowledge is briefly described by each evaluation task and needs to be refined when setting up the scheme.

To ensure that an overall evaluation produces the expected results the competent evaluators need to work as a good team. Especially the evaluators who work on the document parts of the evaluation need to very closely collaborate with the evaluators performing the actual testing; ideally they are the same (set of) persons, especially if the total time span of the evaluation is low.
