Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 182, *Geotechnics*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 341, *Geotechnical Investigation and Testing*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This second edition cancels and replaces the first edition (ISO 22475-1:2006), which has been technically revised.

The main changes compared to the previous edition are as follows:

- clauses on groundwater measurement will be part of ISO 18674-4;
- new sampling categories for soils have been added;
- editorial updates have been made.

A list of all parts in the ISO 22475 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Geotechnical investigation and testing — Sampling methods and groundwater measurements —

Part 1:

Technical principles for the sampling of soil, rock and groundwater

1 Scope

This document deals with principles of sampling of soil, rock and groundwater as part of the programme of geotechnical investigation and testing.

NOTE 1 This document fulfils the requirements for sampling of soil, rock and groundwater, and groundwater measurements as part of the programme of geotechnical investigation and testing according to EN 1997-1 and EN 1997-2.

The aims of such ground investigations are:

- to recover soil, rock and water samples of a quality appropriate to assess the general suitability of a site for geotechnical engineering purposes and to determine the required ground characteristics in the laboratory;
- b) to obtain information on the sequence, thickness and orientation of strata and discontinuities;
- c) to establish the type, composition and condition of strata;
- d) to obtain information on groundwater conditions and recover water samples for assessment of the interaction of groundwater, soil, rock and construction material.

Soil sampling for the purposes of agricultural and environmental soil investigation is not covered.

NOTE 2 Guidance on soil sampling for these purposes including of contaminated or potentially contaminated sites is provided in the ISO 18400 series. ISO 18400-204 provides in addition guidance on sampling and measurement of soil (ground) gas.

NOTE 3 The sampling methods, presented in this document may not be suitable for all types of soil e.g. peat with strong fibrous structure.

NOTE 4 Some of the sampling methods presented in this document are suitable for both soil and rock.

Water sampling for the purposes of quality control, quality characterisation and identification of sources of pollution of water, including bottom deposits and sludges, is not covered.

NOTE 5 Water sampling for these purposes can be found in the ISO 5667 series.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms, definitions and abbreviated terms

For the purposes of this document, the terms and definitions given in ISO 14688-1, ISO 14689 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp
- IEC Electropedia: available at https://www.electropedia.org/

3.1 Ground investigation methods / standards iteh ai

3.1.1

trial pit

open excavation constructed to examine the ground conditions in-situ, recover *samples* (3.3.4) or carry out field testing

3.1.2 s://standards.iteh.ai/catalog/standards/iso/d7274037-f9bf-4c62-909a-6ae062a7d1fb/iso-22475-1-2021 **shaft**

open or steeply inclined excavation, typically more than 5 m deep, constructed to examine the ground conditions in-situ, recover *samples* (3.3.4) or carry out field testing

3.1.3

heading

adit

small tunnel driven horizontally or with a slight inclination from a *shaft* (3.1.2) or into sloping ground to examine the ground conditions in-situ, recover *samples* (3.3.4) or carry out field testing

3.1.4

borehole

hole of any predetermined diameter and length formed in any geological formation or manmade material by drilling (3.1.5)

Note 1 to entry: Investigations carried out in such a hole can be to recover rock, soil or water *samples* (3.3.4) from a specified depth or to carry out field tests and measurements.

3.1.5

drilling

process by which a *borehole* (3.1.4) is produced in any geological formation by rotary, rotary percussive, percussive, resonance/sonic or thrust methods and in any predetermined direction in relation to the *drill rig* (3.2.3)

3.1.6

small diameter drilling

drilling (3.1.5) in the soil with a diameter greater than 30 mm but less than 80 mm

3.1.7

drilling method

technique employed to create and stabilise the *borehole* (3.1.4)

3.2 Drilling rigs and equipment

3.2.1

drilling tool

device, which is attached to, or an integral part of, the drill string that is used for penetrating the geological formation as a cutting tool

3.2.2

drill bit

device, which is attached to, or an integral part of, the drill string that is used as a cutting tool to penetrate the formation being drilled by the *drilling method* (3.1.7) employed

3.2.3

drill rig

device which carries out the *drilling* (3.1.5) function

3.2.4

casing

tubing temporarily or permanently inserted into a borehole (3.1.4)

Note 1 to entry: It is used e.g. to stabilise it, to prevent the loss of *flushing medium* (3.2.5) to the surrounding formation or to prevent cross flow between different groundwater horizons.

3.2.5

flushing medium

liquid or gaseous medium to remove *cuttings* (3.3.10) from the *borehole* (3.1.4), to aid sampling and to lubricate and cool the *drilling tool* (3.2.1) $\frac{1}{274037}$

3.2.6

additive

substance added to the *flushing medium* (3.2.5) in order to affect or change its properties to improve its functioning and can include *borehole* (3.1.4) stabilization

3.2.7

core lifter

split, internally slotted or serrated conical spring steel ring fitted to the core barrel to hold and retain the *core sample* (3.3.8) whilst the core barrel is being hoisted from the *borehole* (3.1.4)

3.2.8

sample retainer

cylindrical device containing flexible spring fingers, hinged wedged-shaped fingers or a hinged flap mounted in a carrier ring and mounted at the lower end of the sampler tube and used to retain the sample (3.3.4) in the tube as the sampler is being lifted from the ground

3.3 Sampling

3.3.1

sampling by drilling continuous sampling

process by which samples (3.3.4) are obtained by the drilling tools (3.2.1) as the borehole (3.1.4) proceeds

Note 1 to entry: The *drilling* (3.1.5) process is designed to obtain complete samples of the length of the borehole. The drilling tools are used as sampling tools.

3.3.2

sampling using sampler

process by which *samples* (3.3.4) are obtained by samplers from *trial pits* (3.1.1), *headings* (3.1.3), *shafts* (3.1.2) or *boreholes* (3.1.4) at selected positions

3.3.3

soil sampling by small diameter drilling

sampling by drilling (3.3.1) in soils using drilling tools (3.2.1) with a diameter greater than 30 mm but less than 80 mm

3.3.4

sample

representative specimen of rock, soil or groundwater recovered from a recorded location

3.3.5

sampling method

set of equipment and procedures employed in a sampling operation

3.3.6

sampling category

sampling methods (3.3.5) to enable a certain quality of soil or rock samples (3.3.4) to be obtained

3.3.7

sampling disturbance

changes to the sample due to the sampling operation

Note 1 to entry: These changes can be of physical, chemical and/or state properties of the sampled material.

3.3.8

core

core sample

cylindrical sample (3.3.4) of soil or rock obtained from a borehole (3.1.4)

3.3.9

block sample

sample (3.3.4) of soil or rock cut out by special techniques to minimise disturbance

3.3.10

cuttings

particles of geological formations formed in the *borehole* (3.1.4) by the cutting action of the *drilling tool* (3.2.1) and carried to the surface by the *flushing medium* (3.2.5) or by an appropriate device

3.3.11

suspended matter

abraded ground material in the *flushing medium* (3.2.5) generated by *drilling* (3.1.5), in which the individual particle size cannot be recognised with the naked eye

3.3.12

core run

length of core sampling in an exploratory hole defined by the start and end depths (or other linear measurement) of the sampling tool

3.3.13

core loss

difference between a core run (3.3.12) and the length of the core (3.3.8) recovered

3.3.14

area ratio

 $C_{\rm a}$

ratio of the area of soil displaced by the sampler tube in proportion to the area of the sample (3.3.4):

$$C_{\rm a} = \frac{{D_2}^2 - {D_1}^2}{{D_1}^2} \cdot 100$$

Note 1 to entry: See Figure 1.

Note 2 to entry: Area ratio is expressed in %.

Note 3 to entry: Area ratio is one of the factors that determine the mechanical disturbance of the soil.

3.3.15

inside clearance ratio

$$C_{i} = \frac{D_{3} - D_{1}}{D_{1}} \cdot 100$$

Note 1 to entry: See Figure 1.

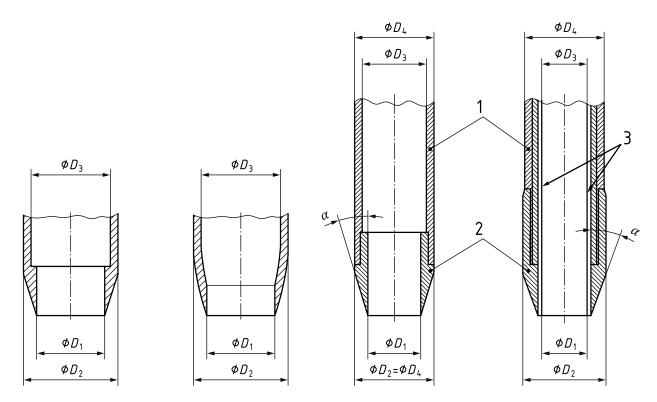

Note 2 to entry: Inside clearance ratio is expressed in %.

Note 3 to entry: Inside clearance ratio is one of the factors that determine the mechanical disturbance of the *sample* (3.3.4) caused by the friction on the inside wall of sample tube or of the liner.

3.3.16

total core recovery in rock

TCR

total length of *core sample* (3.3.8) recovered (solid and non-intact), expressed as a percentage of the length of the *core run* (3.3.12)

Note 1 to entry: See Figure 2.

3.3.17

rock quality designation RQD

summed length of solid core pieces recovered in the *core run* (3.3.12) where each piece is at least 100 mm long between natural fracture, expressed as a percentage

Note 1 to entry: See Figure 2.

3.3.18

solid core recovery

SCR

length of solid *core* (3.3.8) recovered in the *core run* (3.3.12), where solid core has at least one full diameter, expressed as a percentage of the length of the core run

Note 1 to entry: See Figure 2.

Note 2 to entry: A solid core has a full diameter, uninterrupted by natural discontinuities, but not necessarily a full circumference and is commonly measured along the core axis or other scan line.

2 3 2 4 5 RQD 50 % SCR 65 % TCR 90 %

Note 3 to entry: Core without at least one full diameter is termed non-intact.

Key

- 1 drilling (3.1.5) induced fractures
- 2 at least one full diameter
- 3 no single full diameter
- 4 non-intact
- 5 no recovery
- 6 core run

NOTE All features shown are natural discontinuities unless stated otherwise.
