Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 300, *Solid recovered fuels*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

The testing of solid recovered fuels (SRF) enables informed decisions about their subsequent handling and use. In order to carry out a test on a solid recovered fuel, a sample of the material is required. Before any sampling operation is devised, it is important that the objectives for sampling are clearly identified and subsequently well executed to ensure that the expectations of any involved parties are recognized and satisfied. The identification of objectives helps to define the level of testing required, e.g. thorough examination or routine testing, and in addition desired reliability of testing / assessment and frequency of testing. The sampling objectives, along with the sequence of operations required to fulfil them, are detailed in an overall sampling plan. After a sampling plan has been prepared, the sampling of SRF itself can be implemented.

This document is largely based on the work already done by CEN/TC 292 “*Characterization of waste*” (now integrated in CEN/TC 444 “*Environmental characterization of solid matrices*”), in particular EN 14899:2005^[1] and CEN/TR 15310-1:2006^[2].

The main characteristic that makes SRF samples significantly different from other kinds of waste is that SRFs are very often solid, but neither “granular” nor monolithic; it often happens that SRF samples are fibrous-like materials. This typical characteristic of SRF implies that the statistical formula for sampling of EN 14899:2005 and CEN/TR 15310-1:2006, Annex D are not applicable without amendment. The “shape factor” (f) is additionally needed in the statistical formula.

[Figure 1](#) shows the links between the essential elements of a testing program.

Sampling procedures are provided for a range of process streams and common storage conditions. The sampling technique adopted depends on a combination of different characteristics of the material and circumstances encountered at the sampling location. The determining factors are:

- the type of solid recovered fuel;
- the situation at the sampling location / the way in which the material occurs (e.g. in a stockpile, on a conveyor belt, in a lorry);
- the (expected) degree of heterogeneity (e.g. monostreams, mixed fuels, blended fuels).

This document is primarily geared toward laboratories, producers, suppliers and purchasers of solid recovered fuels, but is also useful for the authorities and inspection organizations.

Sampling of solid biofuels is described in ISO 18135^[3].

Solid recovered fuels — Methods for sampling

1 Scope

This document specifies methods for taking samples of solid recovered fuels for example from production plants, from deliveries or from stock. It includes manual and mechanical methods.

It is not applicable to solid recovered fuels that are formed by liquid or sludge, but it includes dewatered sludge.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

CEN/TS 15639, *Solid recovered fuels — Determination of mechanical durability of pellets*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 21637 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

3.1 coefficient of variation
estimate of the standard deviation of a population from a *sample* (3.28) of *n* results divided by the mean of that sample

Note 1 to entry: The coefficient of variation is frequently stated as a percentage.

Note 2 to entry: Adapted from Eurachem/Citac Guide CG 4¹⁴.
<https://standards.iteh.ai/catalog/standards/sist/c2850585-45af-4110-a38d-c1b28e8e191/iso-21645-2021>

3.2 composite sample mass
amount of *sample* (3.28) taken from a *lot* (3.11) or a *sub-lot* (3.40) consisting of all the *increments* (3.9)

3.3 distribution factor
correction factor for the *particle size distribution* (3.20) of the material to be sampled

[SOURCE: ISO 21637:2020, 3.17]

3.4 drop flow
material flow falling over an overflow point or a drop point in a transport system

[SOURCE: ISO 21637:2020, 3.18]

3.5 duplicate sample
two *samples* (3.28) taken under comparable conditions

Note 1 to entry: This selection may be accomplished by taking units adjacent in time or space.

Note 2 to entry: The replicate sample is usually used to estimate sample variability.

[SOURCE: ISO 21637:2020, 3.23, modified – Note 2 to entry has been added.]

3.6 general analysis sample
sub-sample (3.41) of a *laboratory sample* (3.10) having a nominal top size of 1 mm or less and used for a number of chemical and physical analyses

3.7**heterogeneity**

degree to which a property or type of particle of a *solid recovered fuel* (3.34) is not uniformly distributed throughout a quantity of material

[SOURCE: ISO 21637:2020, 3.36]

3.8**homogeneity**

degree to which a property or type of particle of a *solid recovered fuel* (3.34) is uniformly distributed throughout a quantity of material

[SOURCE: ISO 21637:2020, 3.37]

3.9**increment**

portion of *solid recovered fuel* (3.34) extracted from a *lot* (3.11) or *sub-lot* (3.40) in a single operation of the *sampling* (3.30) device

[SOURCE: ISO 21637:2020, 3.39]

3.10**laboratory sample**

composite *sample* (3.28) received by the laboratory on which *sample preparation* (3.29) procedures for analysis are undertaken

Note 1 to entry: When the laboratory sample is further prepared by mixing, subdividing, particle size reduction or by combinations of these operations, the result is the general analysis sample. A test portion is removed from the general analysis sample for the performance of the test or for analysis. When no preparation of the laboratory sample is required, the test portion may be taken directly from the laboratory sample.

3.11**lot**

defined quantity of fuel for which the quality is to be determined

Note 1 to entry: A lot may be divided into sub-lots.

[SOURCE: ISO 13909-1:2016, 3.16^[5]]

3.12**mechanical durability**

ability of densified fuels to remain intact during handling and transportation

Note 1 to entry: Typical measures of resistance are shock and/or abrasion as a consequence of handling and transportation processes, characterized by disintegration and fines formulation.

Note 2 to entry: Examples are briquettes and pellets.

[SOURCE: ISO 21637:2020, 3.41]

3.13**minimum increment mass**

minimum dimension or mass of the increment that is taken from a *lot* (3.11) in a single operation of the *sampling* (3.29) device from the point of view of preserving its representativeness

3.14**minimum sample mass**

minimum amount or dimension of the sample required during *sampling* (3.30) and *sample preparation* (3.29) from the point of view of preserving its representativeness

Note 1 to entry: The minimum sample mass is at least equal to the increment mass multiplied by the number of increments, and is linked directly to the nominal top size.

3.15
moisture

water removable under specific conditions

Note 1 to entry: See also *total moisture* (3.43).

[SOURCE: ISO 21637:2020, 3.46, modified – Note 1 to entry has been added.]

3.16
nominal minimum size

d_{05}
smallest aperture size of the sieve used for determining the *particle size distribution* (3.20) of solid fuels through which at least 5 % by mass of the material passes

3.17
nominal top size

d_{95}
smallest aperture size of the sieve used for determining the *particle size distribution* (3.20) of *solid recovered fuels* (3.34) through which at least 95 % by mass of the total material passes through the sieve

[SOURCE: ISO 21637:2020, 3.48]

3.18
particle density
density of a single particle

Note 1 to entry: Pores within the particle are included.

[SOURCE: ISO 21637:2020, 3.52]

3.19
particle size

size of the fuel particles as determined in a solid fuel

ISO 21645:2021
<https://standards.iteh.ai/catalog/standards/sist/c2850585-45af-4110-a38d-c1b128c8e191/iso-21645-2021>

Note 1 to entry: Different methods of determination can give different results.

Note 2 to entry: See also *particle size distribution* (3.20).

3.20
particle size distribution
proportions of various *particle sizes* (3.19) in a solid fuel

3.21
particle size reduction
reduction of the *nominal top size* (3.17) of a *sample* (3.28) or *sub-sample* (3.41)

3.22
planned increment mass
planned dimension or mass of the *increment* (3.9) that is taken from a *lot* (3.11) in a single operation of the *sampling* (3.30) device

3.23
planned sample mass
sample (3.28) amount or dimension that is planned to be taken during *sampling* (3.29)

Note 1 to entry: The planned sample mass is derived from the minimum sample mass and includes additional considerations regarding the sampling procedure, practical handling and storage and the required sample amounts for analysis.

Note 2 to entry: The planned sample mass can be equal to the minimum sample mass.

3.24 precision

closeness of agreement between independent test/measurement results obtained under stipulated conditions

Note 1 to entry: Precision depends only on the distribution of random errors and does not relate to the true value or the specified value.

Note 2 to entry: The measure of precision is usually expressed in terms of imprecision and computed as a standard deviation of the test results or measurement results. Less precision is reflected by a larger standard deviation.

Note 3 to entry: Quantitative measures of precision depend critically on the stipulated conditions.

[SOURCE: ISO 3534-2:2006, 3.3.4^[6], modified – Second sentence of Note 3 to entry has been removed.]

3.25 producer

organization or unit responsible for the production of *solid recovered fuel* (3.34)

Note 1 to entry: The producer can also be the supplier of the fuel.

Note 2 to entry: The producer may not directly produce or process non-hazardous waste into solid recovered fuel but may receive material appropriate to its requirements and already meeting the minimum criteria of ISO 21640:—.

[SOURCE: ISO 21637:2020, 3.60]

3.26 random sampling

taking a *sample* (3.28) at a random location within a specified range or from a specified *lot* (3.11) such that every portion of the *solid recovered fuel* (3.34) would have the same chance of being part of the sample

Note 1 to entry: A random location is determined by lot

3.27 replicate sampling

taking of *increments* (3.9) at intervals, which are combined in rotation into different containers to give two or more *samples* (3.28) of approximately equal mass

Note 1 to entry: The replicate sampling is usually used to estimate sample variability.

3.28 sample

quantity of material, from a larger amount for which the quality is to be determined

Note 1 to entry: See also *increment* (3.9).

[SOURCE: ISO 21637:2020, 3.63, modified – Note 2 and 3 to entry have been removed.]

3.29 sample preparation

actions taken to obtain representative *laboratory sample* (3.10) or *test portions* (3.42) from the original sample as received

[SOURCE: ISO 21637:2020, 3.66]

3.30 sampling

process of drawing or constituting a *sample* (3.28)

[SOURCE: ISO 21637:2020, 3.68]

3.31

sampling plan

predetermined procedure for the selection, withdrawal, preservation, transportation and preparation of the portions to be removed from a population as a *sample* (3.28)

[SOURCE: ISO 21637:2020, 3.70]

3.32

sampling record

report which serves as a check list and provides the investigator with all necessary information about the *sampling* (3.30) techniques applied at the site and any additional important information

[SOURCE: ISO 11074:2015, 4.4.26^[7], modified – Part of definition has been removed as irrelevant to the context of this document.]

3.33

shape factor

factor that corrects the *minimum sample mass* (3.14) if the particles in a lot have not a regular shape (e.g. spherical or cubic)

[SOURCE: ISO 21637:2020, 3.72]

3.34

solid recovered fuel

solid fuel for energy purposes according to ISO 21640:— derived from non-hazardous waste

Note 1 to entry: A number of terms can be used to describe fuels from waste that might (but not always) qualify as solid recovered fuels. For example, refuse derived fuel, refuse derived paper and plastics densified fuel, waste derived fuel, shredded light fraction, sewage sludge, end of life wood, fuel composed of either municipal solid waste, industrial waste, commercial waste, construction and demolition waste, animal waste (e.g. meat and bone meal).

Note 2 to entry: This definition does not consider the value of the waste.

Note 3 to entry: Whether the input material is hazardous or non-hazardous is determined through national laws and directives or by categorization of the fuel through the annexes in the Basel Convention on the control of transboundary movements of hazardous wastes and their disposal.

[SOURCE: ISO 21637:2020, 3.75]

3.35

specification

document stating requirements

Note 1 to entry: See also *specification of solid recovered fuels* (3.36).

[SOURCE: ISO 9000:2015, 3.8.7^[8], modified - Example and notes to entry have been removed/replaced.]

3.36

specification of solid recovered fuels

list of properties that characterize *solid recovered fuel* (3.34)

Note 1 to entry: A template for such specification is given in ISO 21640:—.

[SOURCE: ISO 21637:2020, 3.76, modified – Note 1 to entry has been added.]

3.37

static lot

lot (3.11) that is not in motion during the *sampling* (3.30), or transported by a conveyor or alternative transport system

[SOURCE: ISO 21637:2020, 3.77]

3.38**stratified random sampling**

stratified *sample* (3.28) constituting by increments which are taken randomly within each stratum

3.39**stratified sampling**

sampling (3.30) constituting by increments taken from identified subparts (strata) of the parent population

Note 1 to entry: Definition derived from 'stratified sample' as defined in ISO 21637:2020, 3.78.

3.40**sub-lot**

part of a *lot* (3.11) for which a test result is required

[SOURCE: ISO 21637:2020, 3.81]

3.41**sub-sample**

portion of a *sample* (3.28)

Note 1 to entry: A sub-sample is obtained by procedures in which the items of interest are randomly distributed in part of equal or unequal size.

Note 2 to entry: A sub-sample may be either a portion of the sample obtained by selection or division of the sample itself, or the final sample of a multistage sample preparation.

[SOURCE: ISO 21637:2020, 3.82]

3.42**test portion**

sub-sample (3.41) either of a *laboratory sample* (3.10) or a test sample required for the specific measurement

Note 1 to entry: The test portion can be taken from the laboratory sample directly if no preparation of sample is required (e.g. for bulk density determination or particle size distribution).

[SOURCE: ISO 21637:2020, 3.83, modified – Note 1 to entry has been added.]

3.43**total moisture****moisture content**

moisture in a fuel measured under specific conditions on as received basis

3.44**trueness**

closeness of agreement between the expectation of a test result or a measurement result and a true value

Note 1 to entry: The measure of trueness is usually expressed in terms of bias.

Note 2 to entry: Trueness is sometimes referred to as "accuracy of the mean". This usage is not recommended.

Note 3 to entry: In practice, the accepted reference value is substituted for the true value.

Note 4 to entry: The determination of the exact trueness for waste and from waste derived materials such as solid recovered fuels is by definition not possible.

[SOURCE: ISO 3534-2:2006, 3.3.3, modified - Note 4 to entry has been added.]

4 Symbols

For the purposes of this document, the following symbols apply.
