65A/986/CDV

COMMITTEE DRAFT FOR VOTE (CDV)

PROJECT NUMBER: IEC 62682 ED2	
DATE OF CIRCULATION: 2020-11-20	CLOSING DATE FOR VOTING: 2021-02-12
SUPERSEDES DOCUMENTS: 65A/952/CD, 65A/984/CC	

IEC SC 65A : SYSTEM ASPECTS	
SECRETARIAT: United Kingdom	SECRETARY: Mr Petar Luzajic
OF INTEREST TO THE FOLLOWING COMMITTEES: TC 57	PROPOSED HORIZONTAL STANDARD: <input type="checkbox"/> Other TC/SCs are requested to indicate their interest, if any, in this CDV to the secretary.
FUNCTIONS CONCERNED: <input type="checkbox"/> EMC <input type="checkbox"/> ENVIRONMENT <input type="checkbox"/> QUALITY ASSURANCE <input type="checkbox"/> SAFETY	
<input checked="" type="checkbox"/> SUBMITTED FOR CENELEC PARALLEL VOTING <input type="checkbox"/> NOT SUBMITTED FOR CENELEC PARALLEL VOTING Attention IEC-CENELEC parallel voting The attention of IEC National Committees, members of CENELEC, is drawn to the fact that this Committee Draft for Vote (CDV) is submitted for parallel voting. The CENELEC members are invited to vote through the CENELEC online voting system.	

This document is still under study and subject to change. It should not be used for reference purposes.

Recipients of this document are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

TITLE:

Management of alarms systems for the process industries

PROPOSED STABILITY DATE: 2024

313

INTERNATIONAL ELECTROTECHNICAL COMMISSION

314

315

316

MANAGEMENT OF ALARMS SYSTEMS FOR THE PROCESS INDUSTRIES

317

318

FOREWORD

319 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising
 320 all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international
 321 co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and
 322 in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports,
 323 Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their
 324 preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with
 325 may participate in this preparatory work. International, governmental and non-governmental organizations liaising
 326 with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for
 327 Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.

328 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international
 329 consensus of opinion on the relevant subjects since each technical committee has representation from all
 330 interested IEC National Committees.

331 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National
 332 Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC
 333 Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any
 334 misinterpretation by any end user.

335 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications
 336 transparently to the maximum extent possible in their national and regional publications. Any divergence between
 337 any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.

338 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity
 339 assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any
 340 services carried out by independent certification bodies.

341 6) All users should ensure that they have the latest edition of this publication.

342 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and
 343 members of its technical committees and IEC National Committees for any personal injury, property damage or
 344 other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and
 345 expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC
 346 Publications.

347 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is
 348 indispensable for the correct application of this publication.

349 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent
 350 rights. IEC shall not be held responsible for identifying any or all such patent rights.

351 International Standard IEC 62682 has been prepared by subcommittee 65A: System aspects,
 352 of IEC technical committee 65: Industrial-process measurement, control and automation.

353 The text of this standard is based on the following documents:

FDIS	Report on voting
65A/704/FDIS	65A/706/RVD

354

355 Full information on the voting for the approval of this standard can be found in the report on
 356 voting indicated in the above table.

357 This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

358

359 The committee has decided that the contents of this publication will remain unchanged until the
360 stability date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to
361 the specific publication. At this date, the publication will be

- 362 • reconfirmed,
- 363 • withdrawn,
- 364 • replaced by a revised edition, or
- 365 • amended.

INTRODUCTION

369 Purpose

370 This standard addresses the development, design, installation, and management of alarm
371 systems in the process industries. Alarm management includes multiple work processes
372 throughout the alarm management lifecycle. This standard defines the terminology and models
373 to develop an alarm system, and it defines the work processes recommended to effectively
374 maintain the alarm throughout the lifecycle. Ineffective alarm systems have often been cited as
375 contributing factors in the investigation reports following major process incidents. This standard
376 is intended to provide a methodology that will result in the improved safety, quality, and
377 operation in the process industries.

378 The 1st edition of this standard was adapted from ANSI/ISA-18.2-2009, *Management of Alarm*
379 *Systems for the Process Industries*, an International Society of Automation (ISA) standard, and
380 with due consideration of other guidance documents that have been developed throughout
381 industry. This 2nd edition has incorporated some changes made in ANSI/ISA-18.2-2016.

382 This standard is not the first effort to define terminology and practices for effective alarm
383 systems. In 1999 the Engineering Equipment and Materials Users' Association (EEMUA) issued
384 Publication 191, *Alarm Systems: A Guide to Design, Management and Procurement*, with the
385 2nd edition published in 2007 and the 3rd edition published in 2013. In 2003 the User Association
386 of Process Control Technology in Chemical and Pharmaceutical Industries (NAMUR) issued
387 worksheet NA 102, *Alarm Management*, which was updated in 2008. During the development
388 and maintenance of this standard every effort was made to keep terminology and practices
389 consistent with the previous work of these respected organizations and committees.

390 This document provides requirements for alarm management and alarm systems. It is intended
391 for those individuals and organizations that

- 392 a) manufacture or implement embedded alarm systems,
- 393 b) manufacture or install third-party alarm system software,
- 394 c) design or install alarm systems,
- 395 d) operate and maintain alarm systems, and
- 396 e) audit or assess alarm system performance.

397 Organization

398 This standard is organized in parts. The first part (Clauses 1 to 3) are normative without any
399 mandatory requirements. Clause 4 contains mandatory requirements. Clause 5 is normative
400 without any mandatory requirements. The main body of the standard (Clauses 6 to 18),
401 describes mandatory requirements and non-mandatory recommendations.

402 Within this standard, mandatory requirements are stated with 'shall', non-mandatory
403 recommendations are stated with 'should', and conditional requirements are state with 'may'.
404 The phrase 'is required' indicates the requirement has been stated previously in the standard.

405 MANAGEMENT OF ALARMS SYSTEMS FOR THE PROCESS INDUSTRIES

406

407 1 Scope

408 1.1 General applicability

409 This standard specifies general principles and processes for the management of alarm systems
410 based on controls system and human-machine interfaces (HMI) for facilities in the process
411 industries. It covers all alarms to be presented to the operator through the control system, which
412 includes alarms from basic process control systems, annunciators, packaged systems (for
413 example refrigeration machines), and safety instrumented systems.

414 The practices in this standard are applicable to continuous, batch, and discrete processes.
415 There can be differences in implementation to meet the specific needs based on those process
416 types.

417 In jurisdictions where the governing authorities (for example national, federal, state, province,
418 county, city) have established process safety design, process safety management, or other
419 requirements, in addition to the requirements of this standard, these should be taken into
420 consideration.

421 The primary function within the alarm system is to notify operators of abnormal process
422 conditions or equipment malfunctions and support the response. The alarm systems can include
423 both the basic process control system (BPCS) and the safety instrumented system (SIS), each
424 of which uses measurements of process conditions and logic to generate alarms. Figure 1
425 illustrates the concepts of alarm and response dataflow through the alarm system. The alarm
426 system also includes a mechanism for communicating the alarm information to the operator via
427 an HMI, usually a computer screen or an annunciator. Additional functions of the alarm system
428 are an alarm and event log, an alarm historian, and the generation of performance metrics for
429 the alarm system. There are external systems that can use the data from the alarm system.

430 Figure 1 is not intended to represent physical wiring.
