## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).
Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO'saldherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: WWw.iso.org/iso/foreword.html.
The committee responsible for this document is ISO/TC 8, Ships and marine technology, Subcommittee SC 6, Navigation and ship operations.

## ISO 13643-2:2017

This second edition cancelstandineplaces lthe finst/edition (ISO13643-2:2013),-of which it constitutes a minor revision with the following changes!98fad499c5/iso-13643-2-2017

- Formula (3) has been changed from " $w=w_{\mathrm{A}}+x_{\mathrm{A}} p-y_{\mathrm{A}} p$ " to " $w=w_{\mathrm{A}}+x_{\mathrm{A}} q-y_{\mathrm{A}} p$ ";
- in 12.2, Paragraph 3, $\left(\Delta \psi_{\mathrm{E}}>60^{\circ}\right)$ has been changed to $\left(\Delta \psi_{\mathrm{E}}<60^{\circ}\right)$ and $\left(\Delta \psi_{\mathrm{E}}<60^{\circ}\right)$ to $\left(\Delta \psi_{\mathrm{E}}>60^{\circ}\right)$;
- in 12.3, Paragraph 3, $\left(\Delta \psi_{\mathrm{E}}>240^{\circ}\right)$ has been changed to $\left(\Delta \psi_{\mathrm{E}}<240^{\circ}\right)$ and $\left(\Delta \psi_{\mathrm{E}}<240^{\circ}\right)$ to $\left(\Delta \psi_{\mathrm{E}}>240^{\circ}\right)$.
A list of all parts in the ISO 13643 series can be found on the ISO website.

## Ships and marine technology - Manoeuvring of ships -

## Part 2: <br> Turning and yaw checking

## 1 Scope

This document defines symbols and terms and provides guidelines for the conduct of tests to give evidences about the turning ability and the yaw containment of surface ships, submarines, and models. It is intended that it be read in conjunction with ISO 13643-1.

## 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 13643-1:2017, Ships and marine technology - Manoeuvring of ships - Part 1: General concepts, quantities and test conditions̄ STANDARD PREVIEW
ISO 80000-1, Quantities and units StPart $F$ General .iteh.ai)
ISO 80000-3, Quantities and units - Part 3: Space and time
ISO 13643-2:2017

For the purposes of this document, the following terms and definitions apply.
ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at http://www.electropedia.org/
- ISO Online browsing platform: available at http://www.iso.org/obp

## 3.1 <br> turning circle test

manoeuvring test to determine the ship's turning characteristics due to application of manoeuvring devices during the period of transient motion and the ensuing steady turn depending on initial speed, manoeuvring device angle or equivalent, and direction of turn

## 3.2

## accelerating turn test

manoeuvring test to determine the ship's behaviour when accelerating from stand-still and simultaneously applying the manoeuvring devices hard over

## 3.3

## thruster turning test

manoeuvring test to determine the capability to turn a ship at zero speed by using its thrusters and to determine the limiting speed at which no more turning effect from bow thrusters can be obtained

Note 1 to entry: This test is relevant to all types and arrangements of tunnel or azimuth thrusters. However, dynamic positioning or traversing tests are beyond the scope of this document.

## 3.4

## zig-zag test

manoeuvring test to determine the ship's turning and yaw checking ability depending upon initial speed, the amount of manoeuvring devices effect applied, and execute change of heading at which the manoeuvring device is applied in the opposite direction (execute change of heading)

## 3.5 <br> course change test

manoeuvring test to determine the ship's capability to change heading by a given angle by use of the manoeuvring devices

## 3.6

## parallel track test

manoeuvring test to determine the behaviour of the ship steering to a parallel track by applying manoeuvring devices and subsequently applying the manoeuvring devices in the opposite sense

## 3.7

## person overboard test

manoeuvring test to determine the change of heading at which the ship is steered back to the reciprocal of its initial track by applying manoeuvring devices hard over

## 3.8

## manoeuvring device

rudder, azimuthing thruster, hydroplane, cycloidal propeller, or equivalent system used to manoeuvre a vessel

## 3.9

## hard over

## iTeh STANDARD PREVIEW

application of the manoeuvring devices to their maximum designed effect

## 4 Test-related physical quantities

/catalog/standards/sist/2bc8d9ae-250a-4a19-a915-
8fad499c5/iso-13643-2-2017
Test-related physical quantities are listed in Table 1. The more general quantities and concepts concerning the manoeuvring of ships are set out in ISO 13643-1.

For quantities and their units, ISO 80000-1 and ISO 80000-3 shall be used.
Table 1 - Test-related physical quantities

| Symbol | CC-code | SI-unit | Term | Concept <br> Definition or explanation |
| :---: | :---: | :---: | :--- | :--- |
| $D_{\mathrm{c}}$ | DC | m | Steady turning diameter | Diameter of ship's track relative to the water once <br> a steady turn is established |
| P |  |  | Port (side) | - |
| $P_{\text {EX }}$ | EXP | - | Extreme point | Point of the after part of the vessel which, during <br> the steady turn, describes the path with the <br> greatest diameter relative to the water |
| $p$ | OMX | rad s-1 a | Roll velocity | (See ISO 13643-1) |
| $q$ | OMY | rad s-1 a | Angular velocity about <br> $y$-axis | (See ISO 13643-1) |
| $r$ | OMZ | rad s-1 a | Angular velocity about <br> $Z-a x i s ~$ | (See ISO 13643-1) |
| S |  | Starboard (side) |  |  |
| $s_{10}$ | SP10 | m | Track reach for $10^{\circ}$ change <br> of heading | Distance along the ship's track at $\Delta \psi=10^{\circ}$ (usually <br> only for $\left.\delta_{\mathrm{Ri}}=10^{\circ}\right)$ |
| $T$ | TIP | s | Time of complete cycle | See Figure 5 |

Table 1 (continued)

| Symbol | CC-code | SI-unit | Concept |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Term | Definition or explanation |
| $t_{\mathrm{E}}$ | TIE | S | Execute time | From $t=0$ to applying the manoeuvring devices in the opposite direction |
| $t_{\text {F }}$ | TIF | S | Time to complete test (run) | For course change test: from start of heading change to $\dot{\psi}=0$ |
|  |  |  |  | For parallel track test: from $t=0$ to again reaching the initial heading $\psi_{0}$ |
|  |  |  |  | For person overboard test: from $t=0$ to reaching reciprocal heading ( $\Delta \psi=180^{\circ}$ ) after applying the manoeuvring devices in the opposite direction |
| $t_{\text {S }}$ | TIS | S | Time to reach maximum change of heading | - |
| $t_{\mathrm{a}}$ | TIA | S | Initial turning time | Until $\psi_{\mathrm{E} 1}$ is reached |
| $t_{\text {c } 1}$ | TIC1 | S | First time to check yaw | From initiating application of manoeuvring devices in the opposite direction until maximum change of heading is reached (indices 1,3 , etc. for overshoot to S) |
| $t_{\text {c }}$ | TIC2 | irsell | Second time to check yaw <br> N A A A A | From initiating application of manoeuvring devices in the opposite direction until maximum change of heading/is reached (indices 2,4 , etc. for overshoot to P) |

|  | CC-code | Si-unit | Term | Definition or explanation |
| $\psi_{\text {E1 }}$ | PSIHE1 | $\mathrm{rad}^{c}$ | Heading for first execute | $\psi_{0}+\Delta \psi_{\mathrm{E}}$ <br> Heading when the manoeuvring devices are applied in the opposite direction (turn to P) |
| $\psi_{\text {E2 }}$ | PSIHE2 | $\operatorname{rad}^{c}$ | Heading for second execute | $\psi_{0}-\Delta \psi_{\mathrm{E}}$ <br> Heading when the manoeuvring devices are applied back in the original direction (turn to S) |
| $\psi_{\mathrm{F}}$ | PSIHF | radc | Final heading | Heading at end of test (run) |
| $\psi_{\text {s }}$ | PSIS | $\mathrm{rad}^{\text {c }}$ | Heading at which the turn becomes steady | - |
| $\psi_{\text {s1 }}$ | PSIS1 | radc | First overshoot angle | During the turn, angle between the heading at which the manoeuvring devices are applied in the opposite direction and the heading at which the vessel ceases to turn in the current direction. Index 1 identifies the first overshoot angle to $S$, and subsequent overshoots to $S$ are identified by indices 3,5 , and so on. |
| $\psi_{\mathrm{s} 2}$ | PSIS2 | radc | Second overshoot angle (standard | Angle between the heading at which the manoeuvring devices are applied back in the original direction and the heading at which the vessel ceases to turn in the current direction. Index 2 identifies the first overshoot angle to P , and subsequent overshoots to P are identified by indices 4,6 , and so on. |
| $\psi_{0}$ | PSIH0 | radc ${ }_{\text {ghtps }}$ | ISO 1364 Initialheading/catalog/standa f98ffad499c5/iso | Heading of a vessel at the commencement of a testrun (sometimes also known as the approach heading) |
| $\dot{\psi}_{C}$ | YARTC | rad s ${ }^{-1}$ a | Rate of turn during steady turn | Rate of change of heading during steady turn. If the wind influence is significant, a rate which would be valid in still conditions shall be derived by averaging. |
| $\dot{\psi}_{\text {MAX }}$ | YARTM | $\mathrm{rad} \mathrm{s}^{-1} \mathrm{a}$ | Maximum rate of turn | Shortly after first, second, etc. application of the manoeuvring devices in the opposite direction $\frac{m_{t}}{m_{\psi}} \tan \alpha$, with $m_{t}$ for the scale of the $t$-axis in $\mathrm{m} / \mathrm{s}$ and $m_{\psi}$ for the scale of the $\psi$-axis in $\mathrm{m} / \mathrm{rad}^{\mathrm{b}}$ |
| ```a For rate of turn, the unit \({ }^{\circ} / \mathrm{s}\) (degree per second) may be used. b The unit kn, common in the navigation, may be used. c For angles, the unit \({ }^{\circ}\) (degree) may be used.``` |  |  |  |  |

## 5 General test conditions

- The general test conditions in ISO 13643-1:2013, Clause 8 shall be observed.
- When operating submerged, submarines shall be trimmed according to the results of the neutral level flight test (see ISO 13643-5:2013, Clause 8). During the test, the dived depth shall be kept as constant as possible. The dived depth and the plane angles are to be recorded continuously. If the submarine is equipped with planes acting into the horizontal as well as into the vertical direction at the same time (e.g. X-planes), these planes should be controlled in such a way that the dived depth is maintained with priority.
- During the test, including the approach phase, each successive position of the ship is to be recorded e.g. using an onboard navigation system during surface operations - at suitable time intervals (usually every second).
- The reference point on the ship relative to which its track is measured should be defined in advance (e.g. location of the antenna). This point is not necessarily identical with the origin of the ship-fixed axis system for which the ship's track shall be given (see ISO 13643-1). If the location of the antenna has the coordinates $\mathrm{x}_{\mathrm{A}}, \mathrm{y}_{\mathrm{A}}$, and $\mathrm{z}_{\mathrm{A}}$ in the ship-fixed axis system and the velocity components measured at this location are $u_{A}, v_{A}$, and $w_{A}$, the velocity components at origin of the ship-fixed axis system are given by:
$u=u_{\mathrm{A}}+y_{\mathrm{A}} r-z_{\mathrm{A}} q$
$v=v_{\mathrm{A}}+x_{\mathrm{A}} r+z_{\mathrm{A}} p$
$w=w_{\mathrm{A}}+x_{\mathrm{A}} q-y_{\mathrm{A}} p$
- Data which shall be recorded continuously include (but need not be limited to) manoeuvring device angle of operation, power setting, speed through the water, heading, rate of turn, heel angle, propeller shaft speed/torque, propeller pitch, true wind velocity and direction, and relative wind velocity and direction.
- Test descriptions are valid for ships. Tests with models are carried out analogously.

## iTeh STANIDARID PREVIEW

## 6 Test 2.1 - Turning circlettestdards.iteh.ai)

### 6.1 General

ISO 13643-2:2017
httos $/ / /$ standards. iteh ai/catalog/standards/sist/2bc8d9ae-250a-4a19-a915-
In addition to the general test conditions 4 ytlined in $15013643-1$ and clause 5 , the following conditions shall be complied with.

- The ship shall be at a steady speed $V_{0}$ before commencing the test. During the test, the propulsion plant settings shall remain unaltered.
- During the approach, the ship is going straight ahead at a steady speed without significant application of a manoeuvring device for at least 2 min . For ships unstable in yaw, realistic minimum manoeuvring device angles should be used during the approach. It is important that during the approach, the ship has as little yaw velocity as possible. To start the test, the manoeuvring devices are applied as required by the specific test as fast as possible in the required direction of the turn and are maintained at that setting during the rest of the test (beginning of the application at $t=0$ ). Following a transient phase, the turn will become steady, i.e. the rate of turn, ship's speed, heel, and drift angle will then all be constant. The steady turn may be disturbed by external influences.
- Applying the manoeuvring devices equally to port (P) or starboard (S) may result in differing responses of the vessels (e.g. dissimilar turning diameters). Consequently, the direction of turn for which the data were measured shall be recorded. The conduct of port and starboard turning circles using the same settings of the manoeuvring devices should be attempted consecutively from the same initial heading, preferably into wind.
- The test is completed after a change of heading of at least $360^{\circ}$ (see Figure 1).

If the submarine's track cannot be determined by means of an inertia platform onboard, the measured speeds $V$ or $u$ have to be used. Generally, it is sufficient to assume $u \approx V$ and to calculate the rate of change of the global coordinates $\dot{x}_{0}$ and $\dot{y}_{0}$ by the formulae:

$$
\begin{align*}
& \dot{x}_{0} \approx u \cos \psi \\
& \dot{y}_{0} \approx u \sin \psi \tag{4}
\end{align*}
$$

Time integration gives the coordinates $x_{0}$ and $y_{0}$ as functions of time.
Average steady drift velocities $u_{\mathrm{d}}$ and $v_{\mathrm{d}}$ in global $x_{0}$ - and $y_{0}$-directions can be determined by:

$$
\begin{equation*}
\frac{1}{2 \pi} \int_{\psi_{\mathrm{s}}}^{\psi_{\mathrm{s}}^{+2 \pi}} \dot{x}_{0} \mathrm{~d} \psi=u_{\mathrm{d}} \tag{5}
\end{equation*}
$$

$$
\begin{equation*}
\frac{1}{2 \pi} \int_{\psi_{\mathrm{s}}}^{\psi_{\mathrm{s}}^{+2 \pi}} \dot{y}_{0} \mathrm{~d} \psi=v_{\mathrm{d}} \tag{6}
\end{equation*}
$$

where $\psi_{\mathrm{S}}$ is the heading at which the turn is expected to become steady. Subtracting $u_{\mathrm{d}}$ and $v_{\mathrm{d}}$ from the measured velocities $\dot{x}_{0}$ and ${ }_{\rho} \dot{y}_{0}$ and integrating to get the track coordinates $x_{0}$ and $y_{0}$ might be a reasonable method to reduce the effect of external influences. Atso, the measured speed, $V$, shall be corrected accordingly, where

$$
\begin{equation*}
V=\sqrt{\left(\dot{x}_{0}-u_{\mathrm{d}}\right)^{2}+\left(\dot{y}_{0}-v_{\mathrm{d}}\right)^{2}} \quad \frac{\text { hitps } / \text { sdandards. iteh.ai/catalog/standards/sist/2bc8d9ae-250a-4a19-a915- }}{\text { 198ffad499c5/iso-13643-2-2017 }} \tag{7}
\end{equation*}
$$
