INTERNATIONAL ELECTROTECHNICAL COMMISSION

MULTIMEDIA SYSTEMS AND EQUIPMENT FOR VEHICLES –**CONFIGURABLE CAR INFOTAINMENT SERVICES (CCIS) –****PART 3: FRAMEWORK****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 63246 has been prepared by the technical area 17: multimedia systems and equipment for vehicles, of IEC technical committee 100:

The text of this standard is based on the following documents:

| FDIS | Report on voting |
|------------|------------------|
| XX/XX/FDIS | XX/XX/RVD |

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 3.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

The National Committees are requested to note that for this publication the stability date is

THIS TEXT IS INCLUDED FOR THE INFORMATION OF THE NATIONAL COMMITTEES AND WILL BE DELETED AT THE PUBLICATION STAGE.

92

INTRODUCTION

93 It is noted that the markets on car infotainment services (as known as in-vehicle infotainment
94 systems) have been growing rapidly, as shown in the growth of the associated industries. It is
95 expected that a variety of car infotainment (or multimedia) devices and services will be newly
96 developed in the future. Such devices include navigations, cameras, speakers, headrest
97 displays, air-conditioners, thermometers and heating seats, and lights. It is also expected that
98 some devices will be developed to provide 4-dimensional experiences for user.

99 Car infotainment systems typically include A/V features (such as standard radio and CD players),
100 and two-way communications tools as well as hands-free phone connections, vehicle voice
101 commands and other types of interactive audios or videos. The car infotainment systems will
102 be evolved to allow passengers to watch movies and other visual media, as shown in the rear
103 seat with DVD capability. Another distinctive feature in the future infotainment systems is the
104 mobile device connectivity. Newer vehicles will provide a wide range of systems that allow
105 devices (e. g., smartphones and laptops) to be connected to a variety of services embedded in
106 the vehicle.

107 From this observation, there is a crucial need on the standardization to provide car infotainment
108 users with more enhanced services so as to easily manage and control infotainment devices as
109 well as contents within a car.

110 The purpose of the IEC 63246 (Configurable Car Infotainment Services, CCIS) series is to
111 specify the general considerations, requirements, framework, and protocols so as to provide
112 car users with the functionality of managing and controlling the device and content resources
113 within a car.

114 The International Standards IEC 63246 consists of the following parts:

115 - Part 1: general;

116 - Part 2: requirements;

117 - Part 3: framework; and

118 - Part 4: protocol.

119 Part 1 of IEC 63246 describes the general considerations of CCIS, which includes the CCIS
120 system model and the types of CCIS users with the associated service flows.

121 Part 2 of IEC 63246 describes the requirements for CCIS, which includes the CCIS functional
122 and service requirements.

123 Part 3 of IEC 63246 describes the CCIS framework, which includes the information flows
124 between CCIS functional entities, such as registration, device monitoring and control, and
125 content delivery.

126 Part 4 of IEC 63246 describes the CCIS protocol, which includes the protocol messages and
127 parameters, protocol procedures, implementation guidelines, etc.

128

MULTIMEDIA SYSTEMS AND EQUIPMENT FOR VEHICLES –
 CONFIGURABLE CAR INFOTAINMENT SERVICES (CCIS) –

PART 3: FRAMEWORK

1. Scope

This part of IEC 63246 describes the CCIS framework, which includes the information flows for registration, device monitoring and control, and content delivery between CCIS functional entities.

2. Normative references

The following document is referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

- IEC 63246-1, Multimedia Systems and Equipment for Vehicles - Configurable Car Infotainment Services – Part 1: General (20XX)
- IEC 63246-2, Multimedia Systems and Equipment for Vehicles - Configurable Car Infotainment Services – Part 2: Requirements (20XX)

3. Definitions and terminology

For the purposes of this document, the terms and definitions given in IEC 63246-1 apply.

4. Reference functional architecture

4.1. CCIS Functions

CCIS functions are divided into several functional blocks: registration, authentication, device control, device monitoring, profile management, and content delivery, as depicted in Figure 1.

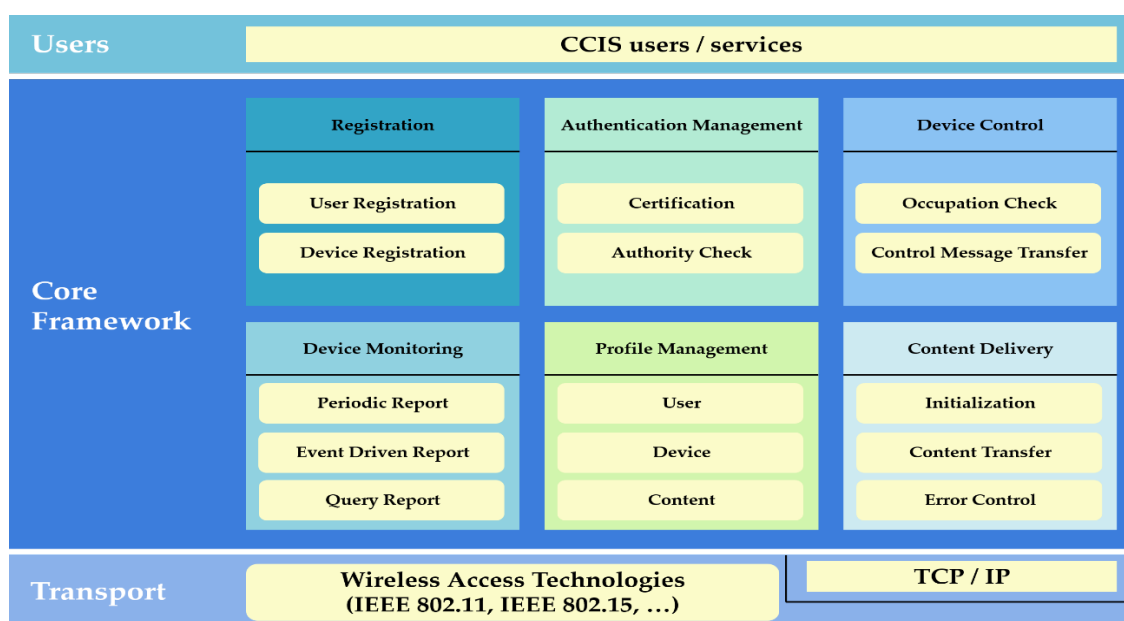

Figure 1 – CCIS functional blocks

157 4.1.1. Registration

158 There are many users and devices in the CCIS system. CCIS master performs the registration
159 function to manage users and devices, which may include the provision of services by authority
160 and automatic certification by storing the profile of registered users and devices.

161 4.1.2. Authentication management

162 CCIS can provide different level of services as per the authority of CCIS user. The CCIS master
163 performs the authority check for users by using authentication key. For this purpose, a CCIS
164 user must obtain the authentication key from the CCIS master.

165 4.1.3. Device control

166 CCIS users can control CCIS devices. To control a specific CCIS device, its occupation status
167 needs to be checked, since a CCIS device may be occupied by the other user. When the device
168 is available, the user can transmit a control message to the device via CCIS master.

169 4.1.4. Device monitoring

170 Each device shall report its latest profile information to CCIS master. Such status report may
171 be generated periodically or by s specific event. The periodic report will be generated based on
172 a timer, whereas the event-driven report will be generated when the device status is changed.
173 In a certain case, the CCIS master can first send a query message to a device.

174 4.1.5. Profile management

175 For effective support of CCIS services, the CCIS master shall store and manage the profile
176 information, such as meta-data of the registered users and devices. This profile information will
177 be referred to during the CCIS functional operations.

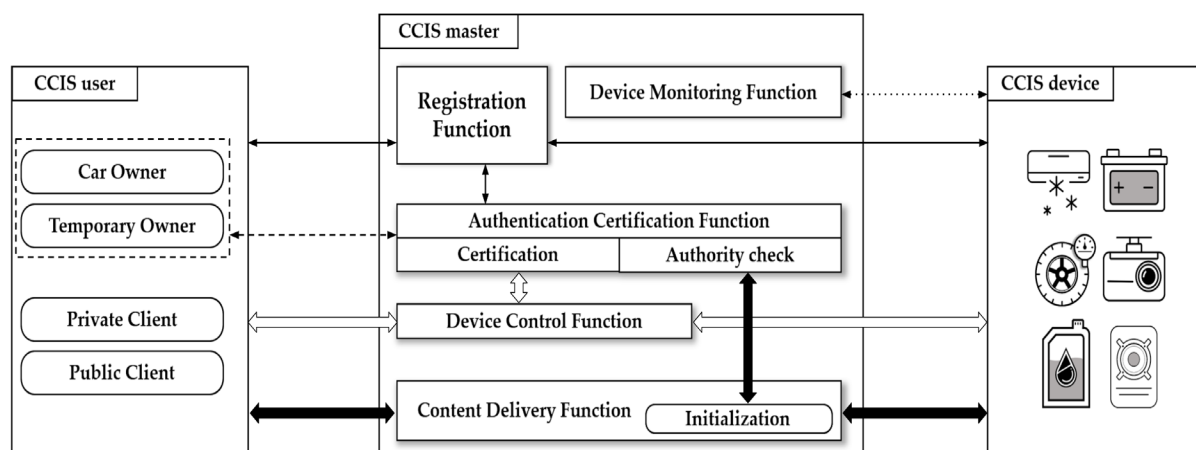

178 4.1.6. Content delivery

179 The CCIS provides content delivery function for exchange of contents, such as multimedia data,
180 between users and devices via CCIS master. The content delivery function may include the
181 content delivery initialization and the content transfer. The content delivery initialization is
182 performed to check the authority of the concerned user for the content delivery service. The
183 error control operation can be performed to provide the reliability for content transfer between
184 device and master, and between user and master.

185 4.2. Functional interworking model

186 Each CCIS function is performed between the CCIS functional entities by interworking with the
187 other functions, as shown in Figure 2, in which the authentication function is interworking with
188 the registration, device control and content delivery functions.

189

190

191

Figure 2 – Interworking of CCIS functions

192 The registration function is applied to users and devices. All users and devices shall be
 193 registered with CCIS master. In the registration process, the authentication/certification function
 194 is used to check the identity or authority. In particular, the registration of private/public clients
 195 and CCIS devices needs the authentication check and admission by Car Owner or Temporary
 196 Owner.

197 The CCIS users perform the device control and **content** delivery functions with the CCIS devices
 198 with the help of CCIS master, in which the authentication process with the owners will be
 199 performed. The device monitoring function is performed between devices and CCIS master.

200

201 4.3. Service level configuration

202 CCIS may provide different service levels for CCIS users. For this purpose, each CCIS service
 203 is categorized into Service Level High, Service Level Medium, and Service Level Low. Table 1
 204 shows an example of the service level configurations, in which each CCIS service is classified
 205 as three levels (high, medium, low), by considering the service features (mission-critical or not)
 206 and the impact on overall CCIS system.

207

208

Table 1 – CCIS service level configuration

| CCIS services | service level high | service level medium | service level low |
|--|--------------------|----------------------|-------------------|
| system settings | ✓ | | |
| device registration and deregistration | ✓ | | |
| authority check | | ✓ | |
| client registration and deregistration | | ✓ | |
| usage of shared service | | ✓ | |
| usage of high-level personal service | ✓ | | |
| usage of medium-level personal service | | ✓ | |
| usage of low-level personal service | | | ✓ |

209

210 In general, Car Owner will use all services with the high, medium, and low levels. Temporary
 211 Owner can use the services with the medium and low levels, whereas Private Client and Public
 212 Client may use only the services with the low level.

213

214 5. Information flows for functional operations

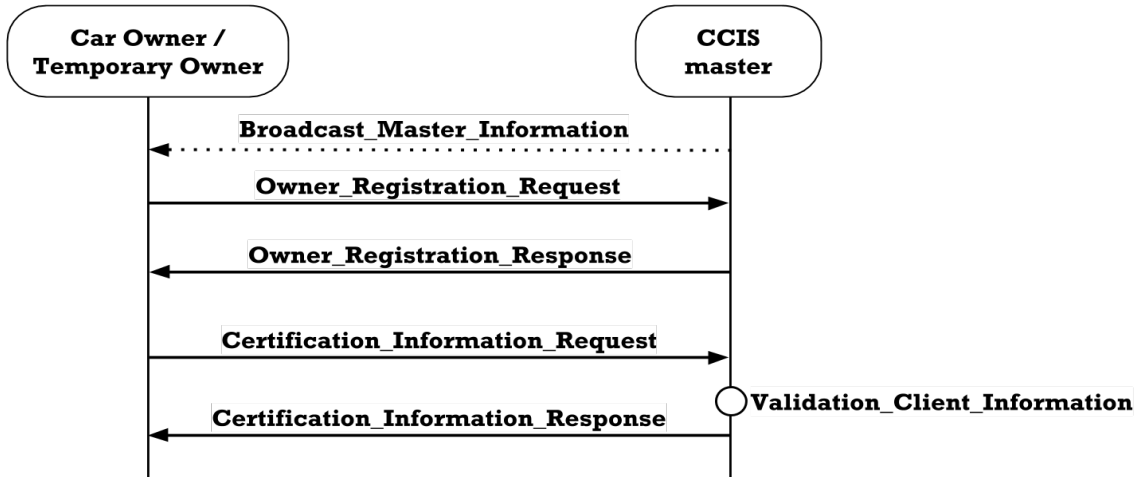

215 5.1. Owner initialization

216 The CCIS owner, Car Owner and Temporary Owner, shall be registered with the CCIS master
 217 in the owner initialization operation, before the CCIS service begins. This is because all CCIS
 218 services are performed with the control of the CCIS owner.

219 Figure 3 shows the information flows for CCIS owner registration. The CCIS master periodically
 220 broadcasts its general information that includes its own identification or the contact address for
 221 registration. CCIS user, who wishes to be CCIS owner, transmits the registration request
 222 message to the CCIS master. Then, the CCIS master sends the owner the response message
 223 that contains the Owner ID generated at the time of registration. After that, the certification
 224 information request and response messages are exchanged between owner and master in
 225 which the certification-related information and authentication key will be exchanged.

226

227

228

229

Figure 3 – Registration of CCIS Owners

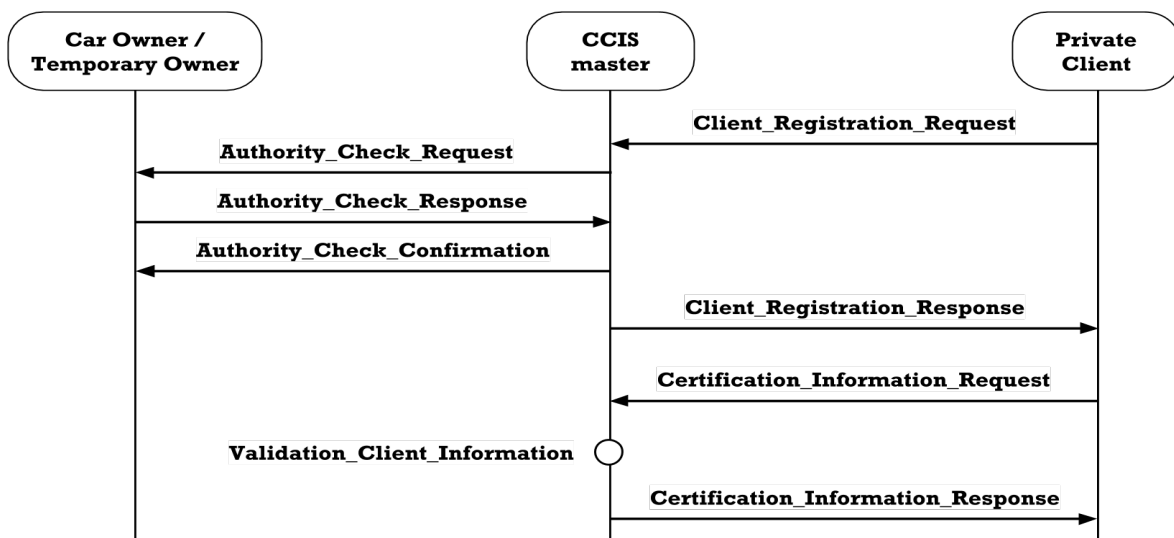

230 **5.2. Client registration**

231 **5.2.1. General**

232 Car Owner and Temporary Owner shall be registered with the CCIS master in the Initialization
 233 operation before CCIS services begins. In the meantime, the client (Private Client or Public
 234 Client) shall be registered with the CCIS master in the registration operation after CCIS services
 235 begin, since its registration needs a permission of Car Owner or Temporary Owner.

236 **5.2.2. Private Client registration**

237 Figure 4 shows the information flows for Private Client registration. A CCIS user that wants to
 238 be Private Client transmits a registration request message to the CCIS master. Upon receiving
 239 the registration request, the CCIS master requests Car Owner or Temporary Owner an authority
 240 check for registration. At this time, Car Owner or Temporary Owner shall be able to
 241 communicate with CCIS master. The authority check is performed in the three-way handshaking
 242 process (request, response, and confirmation). When CCIS master obtains the authority from
 243 Car Owner or Temporary Owner, the CCIS master stores the profile of the Private Client in its
 244 own repository and transmits a response message including Client ID to the Private Client. After
 245 that, the certification information request and response messages are exchanged between
 246 client and master in which the certification-related information and authentication key will be
 247 exchanged.

248

249

Figure 4 – Registration of Private Client
