ISO 21806-2:2020

<https://standards.iteh.ai/catalog/standards/sist/d9b43780-e21b-4983-bf3c-fc140248d3fd/iso-21806-2-2020>

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 22, *Road vehicles*, Subcommittee SC 31, *Data communication*.

A list of all parts in the ISO 21806 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

The Media Oriented Systems Transport (MOST) communication technology was initially developed at the end of the 1990s in order to support complex audio applications in cars. The MOST Cooperation was founded in 1998 with the goal to develop and enable the technology for the automotive industry. Today, MOST¹⁾ enables the transport of high quality of service (QoS) audio and video together with packet data and real-time control to support modern automotive multimedia and similar applications. MOST is a function-oriented communication technology to network a variety of multimedia devices comprising one or more MOST nodes.

Figure 1 shows a MOST network example.

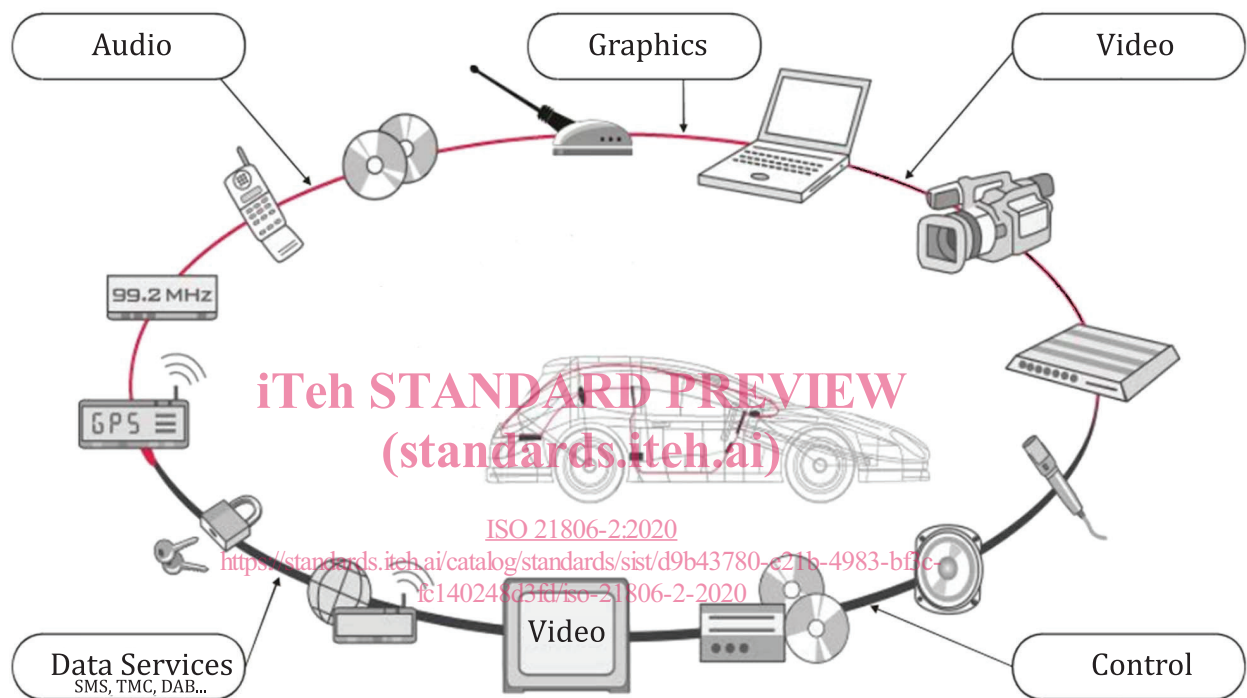

Figure 1 — MOST network example

The MOST communication technology provides:

- synchronous and isochronous streaming,
- small overhead for administrative communication control,
- a functional and hierarchical system model,
- API standardization through a function block (FBlock) framework,
- free partitioning of functionality to real devices,
- service discovery and notification, and
- flexibly scalable automotive-ready Ethernet communication according to ISO/IEC/IEEE 8802-3^[7].

MOST is a synchronous time-division-multiplexing (TDM) network that transports different data types on separate channels at low latency. MOST supports different bit rates and physical layers. The network clock is provided with a continuous data signal.

1) MOST® is the registered trademark of Microchip Technology Inc. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO.

Within the synchronous base data signal, the content of multiple streaming connections and control data is transported. For streaming data connections, bandwidth is reserved to avoid interruptions, collisions, or delays in the transport of the data stream.

MOST specifies mechanisms for sending anisochronous, packet-based data in addition to control data and streaming data. The transmission of packet-based data is separated from the transmission of control data and streaming data. None of them interfere with each other.

A MOST network consists of devices that are connected to one common control channel and packet channel.

In summary, MOST is a network that has mechanisms to transport the various signals and data streams that occur in multimedia and infotainment systems.

The ISO standards maintenance portal (<https://standards.iso.org/iso/>) provides references to MOST specifications implemented in today's road vehicles because easy access via hyperlinks to these specifications is necessary. It references documents that are normative or informative for the MOST versions 4V0, 3V1, 3V0, and 2V5.

The ISO 21806 series has been established in order to specify requirements and recommendations for implementing the MOST communication technology into multimedia devices and to provide conformance test plans for implementing related test tools and test procedures.

To achieve this, the ISO 21806 series is based on the open systems interconnection (OSI) basic reference model in accordance with ISO/IEC 7498-1^[3] and ISO/IEC 10731^[5], which structures communication systems into seven layers as shown in [Figure 2](#). Stream transmission applications use a direct stream data interface (transparent) to the data link layer.

<https://standards.iteh.ai/catalog/standards/sist/d9b43780-e21b-4983-bf3c-fc140248d3fd/iso-21806-2-2020>

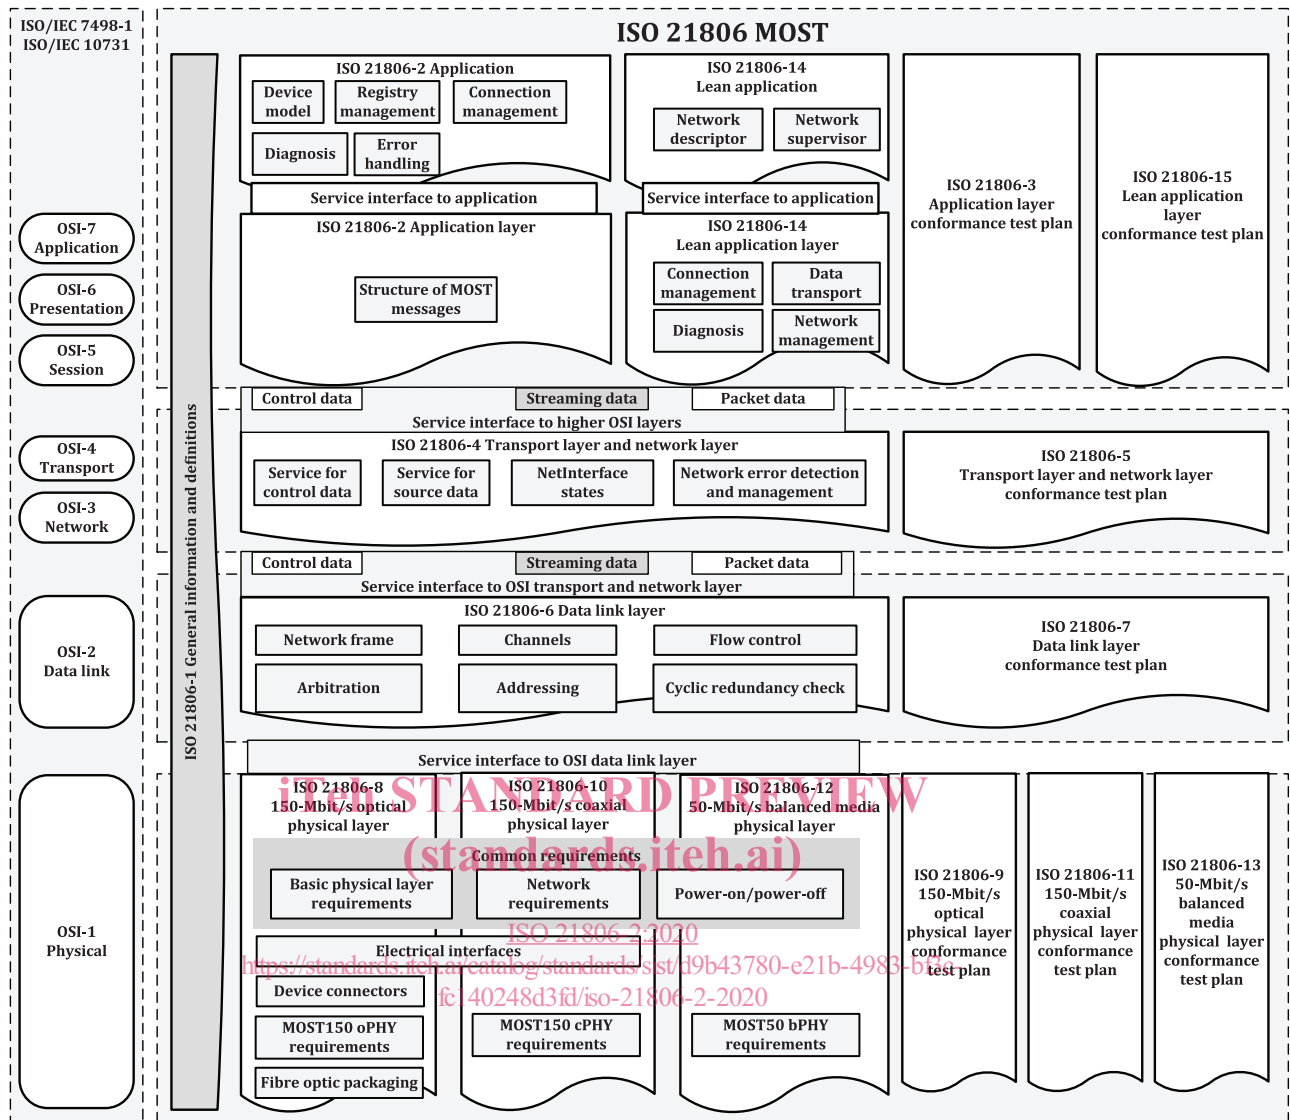

Figure 2 — The ISO 21806 series reference according to the OSI model

The International Organization for Standardization (ISO) draws attention to the fact that it is claimed that compliance with this document may involve the use of a patent.

ISO takes no position concerning the evidence, validity and scope of this patent right.

The holder of this patent right has assured ISO that he/she is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with ISO. Information may be obtained from the patent database available at www.iso.org/patents.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those in the patent database. ISO shall not be held responsible for identifying any or all such patent rights.

Road vehicles — Media Oriented Systems Transport (MOST) —

Part 2: Application layer

1 Scope

This document specifies a part of the application, the application layer, and the presentation layer.

The application covers the

- device model,
- registry management,
- connection management for streaming data,
- diagnosis, and
- error handling.

The application layer covers the structure of MOST messages consisting of

- addressing,
- function block identifiers,
- instance identifiers,
- function identifiers,
- operation types, and
- timing definitions.

The presentation layer covers the definition of data, basic data types and function classes.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 21806-1, *Road vehicles — Media Oriented Systems Transport (MOST) — Part 1: General information and definitions*

IEEE 754-2008, *IEEE Standard for Floating-Point Arithmetic*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 21806-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

3.1

administrative FBlock

FBlock (3.10) that has an administrative purpose, which is specific to the MOST network

3.2

central registry

lookup table in the *NetworkMaster* (3.13) *FBlock* (3.10) for cross-referencing logical node addresses and functional addresses

3.3

central registry state

indicator for the availability of the *central registry* (3.2)

3.4

connection manager

entity that manages streaming connections

3.5

ConnectionMaster

FBlock (3.10) that provides the interface to the *connection manager* (3.4)

3.6

controller

client that uses the services of an *FBlock* (3.10) instance

3.7

decentral registry

lookup table in a *NetworkSlave* (3.14) for determining available *FBlocks* (3.10) and cross-referencing logical node addresses and functional addresses

3.8

FBlock scan

process of collecting information from the *NetworkSlaves* (3.14), performed by the *NetworkMaster* (3.13)

3.9

function

access to a feature of a service in an *FBlock* (3.10)

3.10

function block

FBlock

group of *functions* (3.9) that are particular to a specific application

3.11

method

function (3.9) that can be started and which leads to a result after a certain period of time

3.12

MOST message

message sent with functional address (FBlockID, InstID) as part of the payload

3.13

NetworkMaster

node that controls the *central registry state* (3.3) and administrates the *central registry* (3.2)

3.14**NetworkSlave**

node that reports its *FBlocks* (3.10) to the *NetworkMaster* (3.13)

3.15**notification**

mechanism for informing *controllers* (3.6) about changes in a *property* (3.19)

3.16**notification matrix**

table that contains the logical node addresses of *controllers* (3.6) that require status updates when a *property* (3.19) changes

3.17**PowerMaster**

node that controls MOST network startup and shutdown

3.18**PowerSlave**

node that provides *functions* (3.9) for MOST network startup and shutdown

3.19**property**

function (3.9) for reading or writing a value or status within an *FBlock* (3.10)

5 Conventions

This document is based on OSI service conventions as specified in ISO/IEC 10731^[4].

6 APP — Application

6.1 APP — Device model

The following subclauses describe the logical model of a MOST device. A MOST device is a physical unit that can be connected to a MOST network via a MOST network controller (MNC).

A MOST device contains at least one MOST node, remote-controlled node, or listen-only node. A MOST device implements at least one MNC and MOST transceiver. A device that does not contain a MOST node or a remote-controlled node is beyond the scope of this document.

Between the FBlocks and the MNC, the MOST network service forms an intermediate layer providing routines to simplify the handling of the MNC. A MOST port is the MNC’s connection point to the MOST transceiver.

Figure 3 shows a model of a MOST device with one MOST node and one MOST transceiver. In this example, the MOST node contains two application FBlocks, X and Y, and a controller for FBlock Z.

Application FBlocks are used to group functions that are particular to a specific application, for example radio or telephone. Administrative FBlocks group functions that have an administrative purpose, for example NetworkMaster or NetBlock.

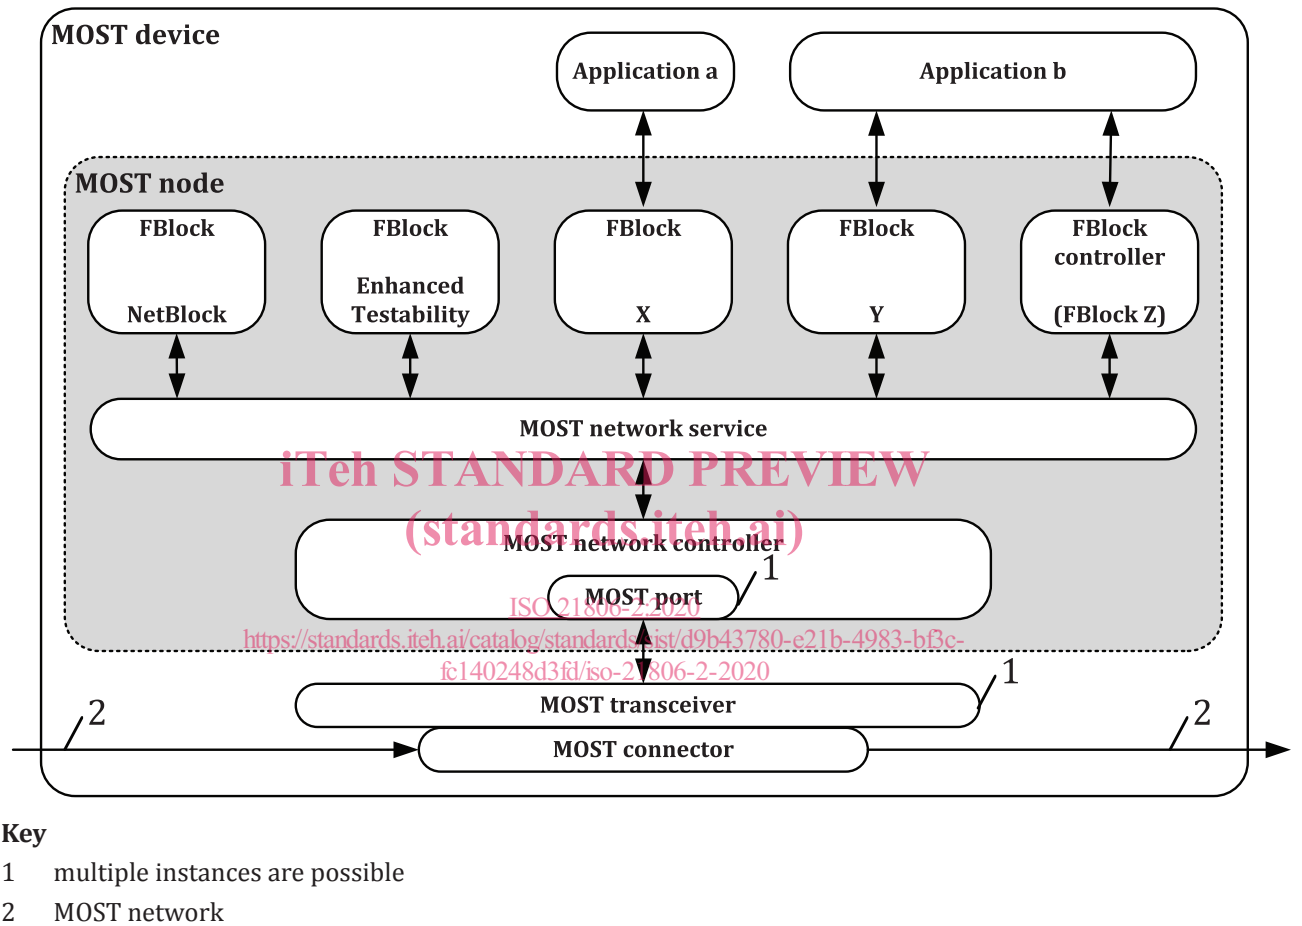

Figure 3 — Example of a MOST device

6.2 APP — Node kinds

6.2.1 APP — MOST nodes

The requirements in this subclause refer to distinctive characteristics of MOST nodes.

REQ	8.1 APP – MOST nodes – Structure
A MOST node shall implement the MOST network service and the MNC.	

REQ	8.2 APP – MOST nodes – Implement NetBlock
A MOST node shall implement the FBlock NetBlock.
