# iTeh STANDARD PREVIEW (standards.iteh.ai)

ISO 21806-6:2020

https://standards.iteh.ai/catalog/standards/sist/61646704-cbd1-44a7-a086-a498bc86aa39/iso-21806-6-2020

#### Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see <a href="www.iso.org/directives">www.iso.org/directives</a>).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see <a href="https://www.iso.org/patents">www.iso.org/patents</a>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see <a href="https://www.iso.org/iso/foreword.html">www.iso.org/iso/foreword.html</a>. (standards.iteh.ai)

This document was prepared by Technical Committee ISO/TC 22, *Road vehicles*, Subcommittee SC 31, *Data communication*.

A list of all parts in the ISO 21806 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at <a href="https://www.iso.org/members.html">www.iso.org/members.html</a>.

### Introduction

The Media Oriented Systems Transport (MOST) communication technology was initially developed at the end of the 1990s in order to support complex audio applications in cars. The MOST Cooperation was founded in 1998 with the goal to develop and enable the technology for the automotive industry. Today, MOST<sup>1)</sup> enables the transport of high quality of service (QoS) audio and video together with packet data and real-time control to support modern automotive multimedia and similar applications. MOST is a function-oriented communication technology to network a variety of multimedia devices comprising one or more MOST nodes.

Figure 1 shows a MOST network example.

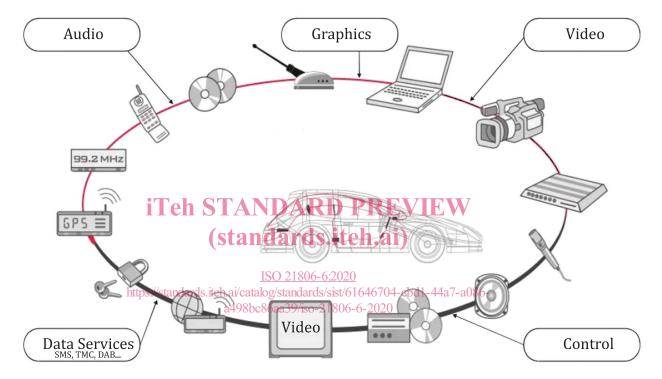

Figure 1 — MOST network example

The MOST communication technology provides

- synchronous and isochronous streaming,
- small overhead for administrative communication control,
- a functional and hierarchical system model,
- API standardization through a function block (FBlock) framework,
- free partitioning of functionality to real devices,
- service discovery and notification, and
- flexibly scalable automotive-ready Ethernet communication according to ISO/IEC/IEEE 8802-3[4].

MOST is a synchronous time-division-multiplexing (TDM) network that transports different data types on separate channels at low latency. MOST supports different bit rates and physical layers. The network clock is provided with a continuous data signal.

<sup>1)</sup> MOST® is the Registered Trademark of Microchip Technology Inc. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO.

Within the synchronous base data signal, the content of multiple streaming connections and control data is transported. For streaming data connections, bandwidth is reserved to avoid interruptions, collisions, or delays in the transport of the data stream.

MOST specifies mechanisms for sending anisochronous, packet-based data in addition to control data and streaming data. The transmission of packet-based data is separated from the transmission of control data and streaming data. None of them interfere with each other.

A MOST network consists of devices that are connected to one common control channel and packet channel.

In summary, MOST is a network that has mechanisms to transport the various signals and data streams that occur in multimedia and infotainment systems.

The ISO standards maintenance portal (<a href="https://standards.iso.org/iso/">https://standards.iso.org/iso/</a>) provides references to MOST specifications implemented in today's road vehicles because easy access via hyperlinks to these specifications is necessary. It references documents that are normative or informative for the MOST versions 4V0, 3V1, 3V0, and 2V5.

The ISO 21806 series has been established in order to specify requirements and recommendations for implementing the MOST communication technology into multimedia devices and to provide conformance test plans for implementing related test tools and test procedures.

To achieve this, the ISO 21806 series is based on the open systems interconnection (OSI) basic reference model in accordance with ISO/IEC 7498-1 $^{[1]}$  and ISO/IEC 10731 $^{[2]}$ , which structures communication systems into seven layers as shown in Figure 2. Stream transmission applications use a direct stream data interface (transparent) to the data link layer.

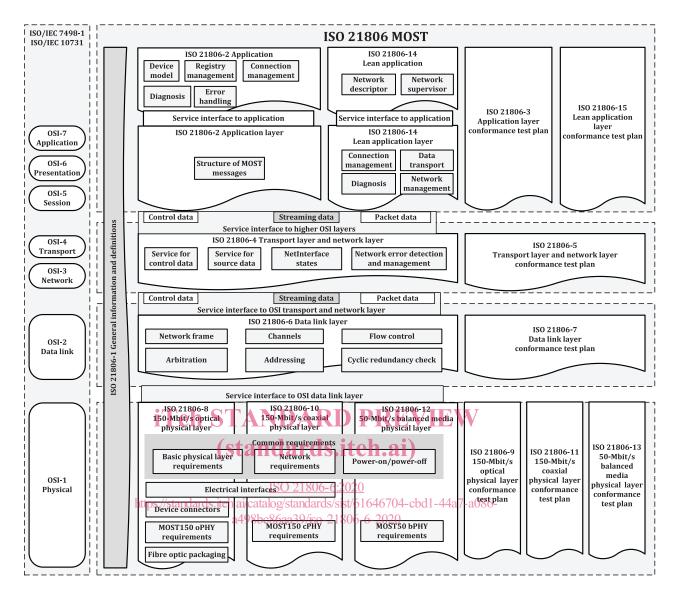

Figure 2 — The ISO 21806 series reference according to the OSI model

The International Organization for Standardization (ISO) draws attention to the fact that it is claimed that compliance with this document may involve the use of a patent.

ISO takes no position concerning the evidence, validity and scope of this patent right.

The holder of this patent right has assured ISO that he/she is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with ISO. Information may be obtained from the patent database available at www.iso.org/patents.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those in the patent database. ISO shall not be held responsible for identifying any or all such patent rights.

# iTeh STANDARD PREVIEW (standards.iteh.ai)

<u>ISO 21806-6:2020</u> https://standards.iteh.ai/catalog/standards/sist/61646704-cbd1-44a7-a086a498bc86aa39/iso-21806-6-2020

# Road vehicles — Media Oriented Systems Transport (MOST) —

# Part 6:

# Data link layer

# 1 Scope

This document specifies technical requirements related to the MOST data link layer functionality.

A MOST network is comprised of two or more nodes connected through a physical layer. The data link layer functionality is provided by each node. On each network, all nodes are synchronised and one node provides the system clock. This node is the TimingMaster, while all other nodes are TimingSlaves. The timing configuration of the node (TimingMaster or TimingSlave) determines the tasks that need to be performed on the data link layer.

The data link layer specifies the following subjects:

- the service interface to the network layer; The STANDARD PREVIEW
- the network frame, its areas and indicators;
   (standards.iteh.ai)
- the different network channels;
- the different flow control mechanisms, 21806-6:2020 https://standards.iteh.ai/catalog/standards/sist/61646704-cbd1-44a7-a086-
- the load-adaptive arbitration and the round-robin arbitration;
- the different addressing options;
- the different cyclic redundancy checks, their usage and the CRC acknowledge;
- the frame indicators.

#### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 21806-1, Road vehicles — Media Oriented Systems Transport (MOST) — Part 1: General information and definitions

#### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 21806-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <a href="https://www.iso.org/obp">https://www.iso.org/obp</a>
- IEC Electropedia: available at <a href="http://www.electropedia.org/">http://www.electropedia.org/</a>

#### 3.1

#### diagnosis flag

flag that determines whether diagnosis is active

#### 3.2

#### **END**

indicator for the end of a channel frame

#### 3.3

#### **Ethernet frame**

frame according to ISO/IEC/IEEE 8802-3

#### 3.4

#### isochronous frame

frame that consists of isochronous data

#### 3.5

#### new allocation flag

flag that is set for newly allocated bytes

#### 3.6

#### packet frame

frame that transports packet data with 16-bit addressing

#### 3.7

#### **PREAMBLE**

PREAMBLE indicator for the start of the network frame

# 3.8

(standards.iteh.ai)

#### protected system channel

channel that transports network status information 1806-6:2020

https://standards.iteh.ai/catalog/standards/sist/61646704-cbd1-44a7-a086a498bc86aa39/iso-21806-6-2020

#### ring lock flag

flag that is set when the TimingMaster locks onto the incoming data stream

#### 3.10

3.9

#### **START**

indicator for the start of a channel frame

#### 3.11

#### static master flag

flag that determines whether the TimingMaster continuously sends network frames

#### 3.12

#### synchronous frame

frame that is synchronous to the network clock and consists of unformatted data

#### 3.13

#### timestamp channel

channel that is used to transport a CRC-protected timestamp

#### 3.14

#### WAIT

indicator that is used for different purposes

# 4 Symbols and abbreviated terms

# 4.1 Symbols

<...> range of bits, e.g. bit 7 to bit 0: <7:0>

... and so on

--- empty cell/undefined

 $N_{\rm PBC}$  packet bandwidth control

 $N_{\rm PBC\ max}$  maximum value of packet bandwidth control

 $N_{\text{SDBPFREST}}$  remaining number of source data bytes per frame

 $N_{\text{TNABPF}}$  total number of administrative bytes per frame

 $N_{\text{TNRPF}}$  total number of bytes per frame

 $N_{\text{TNSDBPF}}$  total number of source data bytes per frame

#### 4.2 Abbreviated terms

SDBPF source data bytes per frame

SOAF start of allocation frame

TM TimingMaster (used in figures)

TS TimingSlave (used in figures)

#### 5 Conventions

This document is based on OSI service conventions as specified in ISO/IEC 10731[2].

# 6 DLL — Service interface to upper layers

#### 6.1 DLL — Overview

The DLL service interface defines the abstract interface to the OSI transport layer and network layer (see ISO 21806-4[3]).

Figure 3 shows the service interface to upper layers.

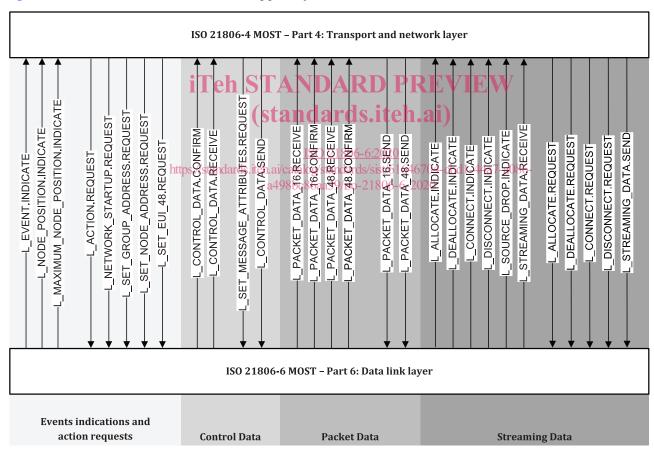

Figure 3 — Service interface to upper layers

### 6.2 DLL — Data type definitions

REQ	2.1 Service interface - DLL - Data type definitions
The data types shall be in accordance to:	

REC	REQ 2.1 Service interface – DLL – Data type definitions	
— Enum: 8-bit enumeration;		
_	— Unsigned Byte: 8-bit unsigned numeric value;	
_	Unsigned Word: 16-bit unsigned numeric value;	
_	EUI-48: 48-bit address value;	
_	Byte Array: sequence of 8-bit aligned data.	

### 6.3 DLL — Parameters

### 6.3.1 DLL — Parameters - DLL to TL/NL

#### 6.3.1.1 DLL — Overview

Table 1 provides an overview of the parameters that are used in the specified service interface and passed from DLL to TL/NL.

Table 1 — Parameters passed from DLL to TL/NL

Parameter	Data type	Description
	Enum {Unlock, Lock, Lock Flag ANDARD PRE Network_Change_Event, Shutdown Frag, rds.iteh.ai MOST_Output_Off, Network_Activity}	An event that is reported to TL/NL.
Node_Position https://stands	Unsigned Byte 21800-0:2020	Node counter
Maximum_Position	Unsigned Byte 30/iso-21806-6-2020	Visible nodes
Transmission_Status	<pre>Enum {Success, Buffer_Full, CRC_Error, Wrong_Target}</pre>	Transmission status that is reported back to the sender.

#### 6.3.1.2 DLL — Network\_Event

The  $\texttt{Network\_Event}$  lists events that are used to notify TL/NL about changes in the DLL, which require no additional information.

REQ	2.2 Service interface - DLL - Parameters - DLL to TL/NL - DLL - Network_Event
The Network_Event parameter shall be of data type Enum and shall use the values defined in Table 2.	

Table 2 — Network\_Event values

Enum value	Description
Unlock	Unlock event occurred
Lock	Lock reached
Lock_Flag	Lock flag detected
Network_Change_Event	The visible nodes value that is distributed by the TimingMaster has changed. Consequently, a network change event (NCE) is generated.
Shutdown_Flag	Shutdown flag detected
Network_Activity_End	Network activity ended
Network_Activity	Network activity detected
