iTeh STANDARD PREVIEW
(standards.iteh.ai)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 184, *Automation systems and integration*, Subcommittee SC 5, *Interoperability, integration, and architecture for enterprise systems and automation applications*.

This second edition cancels and replaces the first edition (ISO 15704:2000), which has been technically revised. It also incorporates the Amendment ISO 15704:2000/Amd.1:2005.

The main changes compared to the previous edition are as follows:

— alignment of terminology for consistency with other standards developed by ISO/TC 184/SC 5;

— incorporation of the rules and guidelines for modelling from ISO 14258 to express enterprise-referencing architecture methodologies;

— revision of content related to recursive structure and iterative methods;

— redrafting of life history concept to address enterprise change management;

— discussion of modelling dimensions necessary for user views, including the extent of detail and composite models that span dimensions;

— harmonization with ISO/IEC/IEEE 42010 and other International Standards related to architecture for enterprise systems;

— inclusion of discussion concerning the relationship of this document with other International Standards related to architecture for enterprise systems (ISO/IEC 10746, IEC 62264, ISO 15745);

— updating of Annex B on Generalized Enterprise Reference Architecture and Methodology (GERAM) in accordance with GERAM 1.6.3.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

0.1 Rationale for enterprise architectures and models

Industrial and information age enterprises create and modify manufacturing and business operations to improve performance in local and global markets. In operation they deploy a variety of resources including people, information systems, automated machinery and business services. Individually and collectively these resources provide the functional capabilities required to perform manufacturing and business processes and their constituent activities. The arrangement, targeting and interworking of resources need to accomplish the enterprise mission, which requires suitable business rules and organizational structures that enable the enterprise to provide products and services in conformance with agreed upon criteria.

Enterprises operate under uncertain and changing market and environmental conditions that make ongoing enterprise engineering beneficial. Enterprises cooperate within a heterogeneous environment with multiple constituents using different models and systems. In addition, most enterprises operate within the context of another enterprise with which it interoperates, as with a supply chain or the parent company. It follows that enterprise personnel have a variety of responsibilities in the conception and ongoing development of the mission, business rules, manufacturing and business processes, organizational structures, and supporting resources and services. Because of the complexity involved in enterprise engineering, invariably it becomes necessary to deploy means of assessing, structuring, coordinating and supporting these engineering activities, including means for collaboration support and interoperation.

Generalized enterprise-referencing architecture concerns and components of enterprise modelling constitute a reference base that provides a generally applicable means of arranging and coordinating enterprise engineering and associated technology development and deployment projects. By adopting and adapting such a reference base, enterprise personnel can cooperate in progressing enterprise engineering projects, improving the enterprise, improving stakeholder's communications and utilizing enterprise resources. By adopting appropriate tool sets, enterprise personnel can reuse in a practical way explicit enterprise designs and models to realize the benefits of enterprise engineering on a continual basis and realize further improvements in enterprise operation.

Such a reference base needs to include capabilities that:

— capture concerns of mission fulfilment stakeholders (manufacturing, transport, service delivery, etc.) and of business stakeholders;

— describe suitable solutions to identified problems within the enterprise;

— model the whole life history of an enterprise integration project from its initial concept through development, operation and finally decommissioning or obsolescence; and

— encompass the people, processes, resources and organizations involved in performing, managing, and controlling the enterprise mission.

From an enterprise engineering perspective, the following distinction is drawn:

— enterprise architecture refers to the arrangement of physical components, logical relationships, and human interactions involved in the development, implementation and operation for a programme such as enterprise integration or other enterprise related programme, usually including a set of projects; and

— system architecture refers to the arrangement of physical components and logical relations of a system that is a constituent of an enterprise; for example, the computer-control-system part of an overall enterprise or product.

This document does not present or adopt specific methodologies for creating or using enterprise architectures or models. The focus is on establishing a reference base capable of supporting specific enterprise programmes, rather than a design intended to fulfil the stated requirements.

This document identifies an extensive collection of potential artefacts for expressing an enterprise-referencing architecture and its associated methodologies. Not all of these artefacts will be applicable, necessary or even desirable for all architecting efforts. The identification of these artefacts assures that this document meets the needs of the widest possible number of enterprise-referencing architecture and methodology situations. Users of this document need to assess not only the value of generating an identified artefact but also the value of maintaining that artefact under the changing circumstances of the referenced enterprise.

0.2 Rationale for this document

Well-designed standards in the domain of enterprise integration and modelling provide a point of reference for enterprise architects and designers, thereby significantly reducing the risk of investing in islands of integration. Where an island does exist, these standards assist the architect or designer to create the translation necessary for the island to interact within an established context. A standard for enterprise-referencing models enhances interoperability by establishing the elements that are required in a model intended to support enterprise architecture.

This document defines concepts, rules and requirements for architecture descriptions that refer to an enterprise, most often articulated as models, with the intent to guide and constrain other standards or implementations that do or will exist on the topic. To realize this intent, this document specifies the concepts to use when producing an enterprise-referencing architecture (see Clause 5) and when constructing enterprise-referencing models (see Clause 6). This document provides a reference base, guidelines and constraints for enterprise architecture and models to anyone engaged in enterprise activities where models are utilized.

0.3 Benefits of this document

The requirements of the reference base for enterprise-referencing architecture and models in this document allow assessment of an enterprise architecture framework or other approach as well as associated methodology and languages for completeness with respect to current and future purpose of the architecture effort. This document will help guide development programmes.

When conforming implementation designs have the same technology areas and nomenclature, or can map to them readily, the information from one enterprise or process is more readily sharable with information of another enterprise or process.

The benefit will be most relevant to any group charged with improving an enterprise infrastructure or its processes. Such a group will find it necessary to either select or create a reference architecture of its own with terminology that pertains specifically to the company, industry, and culture involved. This document will help guide that selection or creation.

This document expects users that are:

— enterprise planners, builders, modifiers, and analysts using the requirements to check completeness of their activity;

— enterprise-referencing model builders using the requirements to assure consistency between models to enable model interoperability; and

— developers of standards for enterprise representation using the requirements to assure consistency between their standards and this document.

NOTE   While the requirements specified herein cover a broad range of enterprise considerations, many users find it advantageous to structure the topics considered into a specific framework for their own work. Such a framework is a methodological choice of the user and goes beyond the scope of this document. Annex B discusses a framework consistent with this document and other International Standards provide further framework guidance.

Enterprise modelling and architecture — Requirements for enterprise-referencing architectures and methodologies

1 Scope

This document specifies a reference base of concepts and principles for enterprise architectures that enable enterprise development, enterprise integration, enterprise interoperability, human understanding and computer processing. This document further specifies requirements for models and languages created for expressing such enterprise architectures.

This document specifies those terms, concepts and principles considered necessary to address stakeholder concerns and to carry out enterprise creation programmes as well as any incremental change projects required by the enterprise throughout the whole life of the enterprise. This document forms the basis by which enterprise architecture and modelling standards can be developed or aligned.

This document does not define standard enterprises, standard organizational structures, standard enterprise processes, or standard enterprise data. In addition, this standard does not specify enterprise modelling processes.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— IEC Electropedia: available at http://www.electropedia.org/

— ISO Online browsing platform: available at http://www.iso.org/obp

3.1
architecture
conceptualization of the form, function, and fitness-for-purpose of an *enterprise* (3.4) in its *environment* (3.9), as embodied in the elements of the enterprise, the relationships between those elements, the relationship of the enterprise to its environment and the principles guiding the design and evolution of the enterprise

Note 1 to entry: Since architecture in an enterprise context, e.g. an enterprise architecture, is always conceptual, the expression of architecture as an architecture description is through models of the enterprise reality to which the architecture applies. Detailed designs conforming to an enterprise architecture description often take less abstract forms as they approach enterprise reality.

Note 2 to entry: The notion of fitness-for-purpose distinguishes architecture from other characteristics of design by adding the obligation of elegance in efficiency and effectiveness to design form and function — a distinguishing characteristic separating an ad hoc assemblage of parts necessary to conduct an enterprise from an intentional composition of constituent elements necessary to achieve and sustain superior enterprise performance.

[SOURCE: ISO/IEC/IEEE 42010:2011, 3.2, modified — Content of original definition has been adapted to the context of this document and Notes to entry have been added.]

3.2
aspect
distinguishing characteristic, manifest by content projection from an integrating *enterprise model* (3.6)

Note 1 to entry: In this document the term aspect usually refers to a collection of concerns that are better addressed by looking across various *views* (3.23), i.e. concerns best addressed by a view across other model views. The scale and scope of these kinds of broad-based concern collections are poorly handled by a single model representation but can be effectively rendered by selecting a composite view from existing model view content.

3.3
business process
partially ordered, often nested, set of *enterprise* (3.4) activities that can be executed to achieve some desired result in pursuit of a specified objective of an enterprise or a part of an enterprise

3.4
enterprise
human undertaking or venture that has explicit and clearly defined *mission* (3.13), goals, and objectives to offer products or services, or to achieve a desired project outcome or business outcome

Note 1 to entry: When in operation, an enterprise functions as a system that realizes the mission through life cycle activities within a life history.

Note 2 to entry: In this document, "enterprise" refers to concrete (e.g. company, project or extended supply chain enterprise) or abstract (e.g. virtual enterprise) entities.

Note 3 to entry: One or more organizational unit participates in an enterprise. For an enterprise involving more than one such unit, each brings various *resources* (3.21) forward for use, participating to the extent that it benefits from their involvement, which most often occurs to address some challenge that it is unable to address on its own.

3.5
enterprise engineering
discipline applied in carrying out any efforts to establish, modify, or reorganize any *enterprise* (3.4)

Note 1 to entry: An enterprise engineering and architecting methodology provides guidance for efforts to establish, modify, validate or reorganize an enterprise.

3.6
enterprise model
representation of an *enterprise* (3.4) as well as entities within an enterprise, their interrelationships, their decomposition and detailing to the extent necessary to convey what the enterprise intends to accomplish and how it operates

Note 1 to entry: An enterprise model, which is used to improve the effectiveness and efficiency of the enterprise, identifies and specifies essential components and elements to any necessary extent of detail, including any subsystems and constituent models of the enterprise, e.g. an enterprise *architecture* (3.1) model.

[SOURCE: ISO 19439:2006, 3.23, modified — The words "abstraction of an enterprise domain that represents enterprise entities" have been replaced with "representation of an enterprise as well as entities within an enterprise", the words "what it intends" have been replaced with "what the enterprise intends", and Note 1 to entry has been added.]

3.7
enterprise-referencing
applicable to an *entity* (3.8) that is, or includes, or is part of an *enterprise* (3.4)

Note 1 to entry: A generic enterprise *architecture* (3.1), an architecture for a specific enterprise, and an architecture that includes an enterprise as one of its elements are all enterprise-referencing architectures.

3.8
entity
concrete or abstract thing in the domain under consideration

[SOURCE: ISO 19439:2006, 3.29]

3.9
environment
context that determines the setting and circumstances of technological, business, operational, organizational, political, regulatory, social, and other critical influences and constraints upon an *enterprise* (3.4), which affect or are affected by its development and behaviour, but are not controllable by the enterprise itself

Note 1 to entry: In the case of a nested enterprise, its environment may be within the larger enterprise.

[SOURCE: ISO/IEC/IEEE 42010:2011, 3.8, modified — Content of original definition has been adapted to the context of this document, incorporating content from ISO 19439:2006, 3.30, and Note to entry has been added.]

3.10
framework
structure expressed in diagrams, text and formal rules which relates the elements of an *enterprise* (3.4) *architecture* (3.1) to each other

Note 1 to entry: The purpose of a framework is to guide creation of one or more enterprise architecture descriptions.

iTeh STANDARD PREVIEW
(standards.iteh.ai)

[SOURCE: ISO 19439:2006, 3.31, modified — The words "the components of a conceptual entity" have been replaced with "the elements of an enterprise architecture", and Note 1 to entry has been added.]

3.11
genericity
extent to which a concept generalizes entities in a category or group

3.12
life cycle
set of distinguishable phases and steps within phases which an *entity* (3.8) goes through from its creation until it ceases to exist

Note 1 to entry: The phases of a nested *enterprise* (3.4) can be steps within the life cycle of the containing enterprise.

[SOURCE: ISO 19439:2006, 3.42, modified — Note 1 to entry has been added.]

3.13
life history
actual, recorded and configuration managed sequence of phases and steps within phases that an *entity* (3.8) goes through during its lifetime

3.14
mission
characterization of the effect that an *enterprise* (3.4) expects to achieve through the fulfilment of functional requests for products or services

3.15
model
representation of certain entities and their characteristics either (a) using a formalism, or (b) using an established or ad hoc modelling paradigm, approach, or technique

Note 1 to entry: An ad hoc model is more difficult to implement using an established design technique.

Note 2 to entry: A model may be a subset of a broader model.

3.16
model-based
represented using a formalism which has a formal syntax and semantics, usually with a theoretical basis, and expressible in a symbolic language

Note 1 to entry: Presentation of such models is often graphical but the definition mandates that the graphical representation be translatable into a symbolic language, thereby constraining interpretation of the graphical representation.

Note 2 to entry: In order to satisfy specific *stakeholder* (3.22) concerns, "model-based" is often used as a qualifier to characterize a kind of design, or practice, e.g. model-based system engineering, model-based design, model-based specification.

3.17
modelling dimension
conceptual collection of *enterprise* (3.4) *entity* (3.8) *viewpoints* (3.24) related by kinds of architectural concerns and exhibiting reasonably distinct aggregating coordinates along a continuum

Note 1 to entry: Common modelling dimensions are life cycle, viewpoint, and *genericity* (3.11).

3.18
organization
distribution of responsibilities and authorities in the *enterprise* (3.4)

Note 1 to entry: Within an organization, people are often given role titles designating collections of responsibilities and authorities with roles arranged in an accountability hierarchy.

3.19
perspective
orientation of a *stakeholder* (3.22) or *model* (3.15) user relative to an identified domain

Note 1 to entry: A stakeholder's orientation can be formed by stakeholder concerns, as well as by their training, experience, cultural background, and their motivations.

3.20
reference base
source of information comprising descriptions of generalized *enterprise* (3.4) *architecture* (3.1) concepts, requirements and recommendations

3.21
resource
entity (3.8) that provides some or all of the capabilities required to execute an *enterprise* (3.4) activity

Note 1 to entry: In this document, resource is used in the system theory sense of entities that provide capabilities required by the system and are an essential part of the system itself. The resource description includes the identification and description of consumables (such as energy, air, coolant) that are required to be present in sufficient quantities to operate the resource. In contrast, material is reserved for process inputs that are required by the various activities such as raw materials, parts and assemblies.

Note 2 to entry: In this document, the term "resource" applies to non-human entities involved in enterprise entity operation. The involvement of humans is described by roles they carry out in the enterprise entity operation.

[SOURCE: ISO 19439:2006, 3.60, modified — The word "enterprise" has been deleted at the start of the definition, the last sentence of Note 1 to entry has been removed, and Note 2 to entry has been added.]

3.22
stakeholder
individual, team, organizational unit, or class thereof, having concerns relative to their *perspective* (3.19) about an *enterprise* (3.4), or its *architecture* (3.1), or in an architecture *entity* (3.8) of the enterprise

Note 1 to entry: Typical enterprise stakeholders include enterprise owners, enterprise customers, and enterprise employees responsible for receiving or delivering either products or services, and those persons or *organizations* (3.18) partnering with the enterprise to achieve its mission.

Note 2 to entry: Enterprise architects are stakeholders of the enterprise architecture, but not necessarily stakeholders of the enterprise itself. A user of enterprise architecture or related models is an enterprise stakeholder. There can be observers of an enterprise that are not stakeholders for that enterprise.

[SOURCE: ISO/IEC/IEEE 42010:2011, 3.10, modified — Content of original definition has been adapted to the context of this document and Notes to entry have been added.]

3.23
view
work product expressing a selective perception or representation of a *model* (3.15), which emphasizes some specific feature or characteristic and disregards others

[SOURCE: ISO 19439:2006, 3.25, modified — Content of original definition has been adapted to the context of this document.]

3.24
viewpoint
identification of one or more kind of *model* (3.15) useful for addressing a collection of related *stakeholder* (3.22) concerns

Note 1 to entry: When the term viewpoint is used without any qualifier it refers to the general case. When the term viewpoint is used with a qualifier, the viewpoint applies to a specific collection of concerns, e.g. operational viewpoint, capability viewpoint, services viewpoint.

Note 2 to entry: A viewpoint identifies one or more models necessary and sufficient for expressing one or more *enterprise model* (3.6) *views* (3.23) that address the specific collection of related stakeholder concerns.

5 Requirements for enterprise-referencing architectures and models

5.1 General requirements

The requirements for enterprise-referencing architectures and models are cast as a framework relying upon the key principles of enterprise integration and interoperation found in Annex A.

The framework comprises the requirements for enterprise-referencing architectures in Clause 5 and models with modelling languages and associated methodologies in Clause 6. These architecture and model requirements assist with planning enterprise integration and interoperation by an individual or team, which determines and develops a course of action that is complete, accurate, and properly oriented to future business developments and economy of resources. The planners shall establish the following objectives among other potential objectives:

a) identify enterprise boundaries and relevant relationships to the environment in which it operates;

b) define present and possible future enterprise objectives;

c) describe significant tasks to perform;

d) identify the necessary kinds and quantity of information;

e) identify relevant enterprise elements and their relationships to enterprise objectives;

f) specify relationships among humans, processes, and equipment for the interoperation considered;

g) specify sufficient management functions and responsibilities;

h) identify relevant economic, cultural, and technological factors;

i) describe the extent of automation-support required;

j) provide modelling that can trace the whole life history of an enterprise entity including entity and relationship evolution;

k) describe decision-making structures and means for detecting inconsistencies;

l) maintain both human readable and machine processable forms of expression;

m) measure sufficiency and efficiency of enterprise architecting methodology as the extent to which the enterprise achieves objectives.

Enterprise-referencing architectures and models can address the role of humans, the description of processes, the identification of information, their relationships, and the representation of all supporting technologies throughout the life cycle of the enterprise.

Effort applied to the development of architectures, models and views needs to remain cognizant of the intended objectives and benefits to the enterprise, and to balance the effort required to achieve these outcomes. Typically, effort will be constrained by cost and/or schedule.

5.2 Applicability and coverage of enterprise architecture

5.2.1 Kinds of enterprise

Enterprise-referencing architectures and the models that represent those architectures should be suitable for supporting the engineering of manufacturing and business enterprises of many conceivable sizes or varieties. Supported enterprise entities may be independent enterprises, e.g. companies, or parts of an enterprise, e.g. divisions, departments, or the business of collaborating and cooperating enterprises, e.g. supply chains, virtual enterprises, or even the enterprise operational systems or products. Reference architectures may exist for specific enterprises or systems, e.g. discrete parts manufacturing, process industries, complex system of systems interactions and behaviours, and information systems. The breadth and depth of the domain covered by an enterprise-referencing architecture and its representational models shall be identified clearly.

5.2.2 Characterizing enterprise architecture

A distinguishing characteristic of enterprise architecture arises because of the nature of enterprise creation and the purpose of the architecture relative to that enterprise. One kind of architecture — system architecture — relates to the design of a system, e.g., the computer control system part of an overall enterprise integration project. Another kind of architecture — enterprise architecture — involves the design of the enterprise that produces that system architecture. Enterprise architecture enables the creation of the system architecture by structuring the development and implementation of a project such as an enterprise integration or other enterprise development programme, which includes the creation of architecture descriptions in support of enterprise products or services.

Any elaboration or derivative of this document as a reference base for enterprise-referencing architecture and models shall be applicable for each enterprise entity within a specified domain.

The concrete form of an enterprise architecture conceptualization shall be as an architecture description, such description being suitable to the purpose for which the conceptualization occurs.

NOTE 1   In this document, the appearance of the term "architecture" often means its concrete form as an architecture description.

NOTE 2   Often one enterprise architecture supports the development and implementation of another enterprise, which produces its own enterprise architecture in support of the development and implementation of a product or service. See Annex B for more discussion of enterprise and architecture kinds and relationships among enterprise architectures.

5.2.3 Enterprise engineering and architecting methodology

A methodology, using this document or an elaboration or derivative of this document as a reference base, shall provide the necessary guidelines and management techniques for the identification of projects or programmes that support the deployment of an enterprise entity. Such a methodology can be model-based. While the enterprise engineering process can result in a specific enterprise model, the methodology shall be suitable for expressing concepts as described in 5.3 and components as described in Clause 6.

Such methodologies shall guide the user in the process of change management and provide methods of progression for every kind of life cycle activity for any enterprise entity within the scope of the reference base. These methodologies shall describe the process of enterprise integration and enterprise modelling that may include conceiving, defining, expressing, documenting, communicating, certifying proper implementation of, maintaining and improving the architecture of an enterprise. Different methodologies can exist to accommodate different characteristics of the enterprise change processes, whether complete integration processes, or incremental changes as experienced in a continuous improvement process.

NOTE   Enterprise architectures and models need not rely upon a specific methodology and its accompanying framework. Potentially, many different methodologies and/or frameworks are possible to achieve the desired outcome. The primary consideration is applicability and suitability in relation to these requirements.
