## European foreword

This document (CEN/TR 17419-2:2021) has been prepared by Technical Committee CEN/TC 445 “Digital Information Interchange in the Insurance Industry”, the secretariat of which is held by DIN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

Any feedback and questions on this document should be directed to the users’ national standards body. A complete listing of these bodies can be found on the CEN website.

## iTeh STANDARD PREVIEW (standards.iteh.ai)

[SIST-TP CEN/TR 17419-2:2021](https://standards.iteh.ai/catalog/standards/sist/2d81ca23-b0c4-40f6-838f-d1a588de5922/sist-tp-cen-tr-17419-2-2021)

<https://standards.iteh.ai/catalog/standards/sist/2d81ca23-b0c4-40f6-838f-d1a588de5922/sist-tp-cen-tr-17419-2-2021>

## CEN/TR 17419-2:2021 (E)

## Introduction

The EN 17419-1:2020, *Digital Information Interchange in the Insurance Industry — Transfer of electronic documents — Part 1: Process and Data Model*, defines the transfer of electronic documents between stakeholders in the insurance industry (for example between insurers and intermediaries):

- the semantic process for the transfer of documents that may be transferred as an attached file; and
- a limited number of meta data describing the document.

The definitions are described in the standard on a semantic level with process and data models in a syntax-neutral format independent from its representation in a concrete implementation syntax.

This document exemplifies a concrete implementation of the EN 17419-1:2020 as an OpenAPI specification. The OpenAPI syntax is published by the OpenAPI Initiative, an open-source collaboration project of the Linux Foundation, and is a specification for machine-readable interface files for describing, producing, consuming, and visualizing RESTful web services.

This document is a guide for organizations that want to implement the EN 17419-1:2020. Even more, the specification contained in this document can be directly implemented with OpenAPI tools that can automatically generate code, documentation and test cases.

All stakeholders that want to implement EN 17419-1:2020 will benefit from the implementation guide described in this document due to:

- Uniform implementation of EN 17419-1:2020 across the industry, based on a common technology.
- Avoidance of divergent implementations, thus avoiding incompatible digital interfaces between the stakeholders.
- Implementation for RESTful web services, a common micro-service technology.
- Specification in OpenAPI syntax, a common basis for the definition of RESTful web services.
- Automatic generation of code, documentation and test cases, based on OpenAPI tools.
- Facilitated implementation will accelerated the application of EN 17419-1:2020.
- Facilitated implementation will accelerated the usage of EN 17419 by SMEs.

## 1 Scope

This document specifies a concrete REST webservice API description of the processes and data (see EN 17419-1:2020 for more information) as an OpenAPI definition specified by the OpenAPI specification.

## 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 17419-1:2020, *Digital Information Interchange in the Insurance Industry — Transfer of electronic documents — Part 1: Process and Data Model*

## 3 Terms, definitions and abbreviations

### 3.1 Terms and Definitions

For the purposes of this document, the terms and definitions given in EN 17419-1:2020 apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <https://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

### 3.2 Abbreviations

API	Application Programming Interfaces
JSON	JavaScript Object Notation
OAS	OpenAPI Specification
OAI	OpenAPI Initiative
REST	Representational State Transfer
SOAP	Simple Object Access Protocol
XML	Extensible Markup Language
YAML	Yet Another Markup Language
	YAML Ain't Markup Language

## 4 Technical basis for OpenAPI definition

### 4.1 Cloud services and REST

In a more and more communication based and service orientated IT infrastructure, the ease of use, implementation, operation and maintenance of IT-services as main economic success factors determine the type of underlying architectures and tools to be used. Cloud enabling of services as one strategic aspect allows to reduce the time to market of products while focussing on core competence – the business aspects - of IT activities.

**CEN/TR 17419-2:2021 (E)**

REST APIs as a software architecture describe interfaces to communicate through the HTTP(S) protocol between distributed client and server systems as an alternative to SOAP. RESTful implemented services are stateless. That means, all data required for creating a service response is transmitted in the corresponding service request. Advantages of RESTful services are a better visibility, reliability and scalability.

**4.2 JSON data format**

IETF RFC 8259, The JavaScript Object Notation (JSON) Data Interchange Format (<https://tools.ietf.org/html/rfc8259>)

ECMA-262, ECMAScript® Language Specification (<https://www.ecma-international.org>)

With REST-Services usually the JSON data format, as a derivation or concretization of the YAML format is used, which is very slim and better human readable in contrast to the structure description orientated language of XML. JSON is more a syntactical convention for describing data in a given context by allowing an easy machine processing and parsing because of its strict structure definition.

Based on the JavaScript Programming Language Standard ECMA (<http://www.ecma-international.org>), the data interchange format JSON was first specified by Douglas Crockford in 1999.

**4.3 YAML data format**

Oren Ben-Kiki – Clark Evans – Ingy döt Net, YAML Ain't Markup Language (YAML™) Version 1.2 (<https://yaml.org/spec/1.2/spec.html>)

YAML is a simplified markup language to describe data in a more human readable way. It was invented in about 2001 and the most current version 1.2 (3rd Edition) was published in 2009.

YAML can be viewed as an easy to implement and use natural and consistent superset of JSON. Every JSON file is also a valid YAML file. The main focus on YAML is to provide a programming language independent data interchange format as a technical markup language with a maximum in human readability and information providing.

It consists mostly of a kind of key-value mechanism where values also may be lists (arrays) itself.

**4.4 OpenAPI Specification**

The OpenAPI Specification (OAS, <https://www.openapis.org>) defines a vendor neutral and human readable interface description for REST APIs, originally based on the Swagger Specification (Open Source Framework Swagger for HTML-Webservices) and was provided in 2016 by the OpenAPI Initiative (<https://www.openapis.org>). Further development and maintenance is done by the initiative and is supported of the Linux Foundation.

OpenAPI descriptions of REST APIs are implemented in OpenAPI documents. An OpenAPI document that conforms to the OpenAPI Specification is itself a JSON object, which may be represented either in JSON or YAML format.

There is an uncountable number of tools available in the world wide web for creating or dealing with OpenAPI documents. One important Open Source tool is the Swagger-Editor (<https://swagger.io/tools/swagger-editor/>), which allows the creation of OpenAPI conformed REST API definitions and the generation of documentation and code stubs for several client and server programming languages and runtime environments.

## 5 OpenAPI specification for EN 17419-1:2020

### 5.1 Introduction

This document describes a sample REST interface of the processes specified in EN 17419-1:2020 for Transfer of electronic documents.

The EN 17419-1:2020 itself defines the processes and the structure (data model) of the transfer of electronic documents and facilitates the transfer of electronic documents between stakeholders in the insurance industry.

This API description concentrates on a synchronous transmission process (through http method POST). Therefore a successful or unsuccessful transmission on a technical level is expressed as a direct (synchronous) response of the webservice request.

### 5.2 OpenAPI document

Clause 5.3 contains the complete API description of a sample REST service as an OpenAPI document in YAML format.

**NOTE 1** As the OpenAPI specification defines strict rules for syntax and grammar of OpenAPI documents, so remember to especially keep the indentation of all given YAML and JSON as is to not destroy any consistency and/or semantics.

**NOTE 2** Due to compatibility issues to the UN/CEFACT Core Components Library (UN/CCL) on which the data model is based on, in some classes there are several attributes defined but are not allowed to be used in explicit context situations. To take this into account for the classes in question this technical report introduces the construction of base classes containing only mandatory attributes used in all context situations. The classes in situations where all attributes are used are then derived from the base classes. As an example, within the class Communication the attribute URI of type Identifier must only use the attribute Identifier.Content. Therefore IdentifierBase is introduced as base class with only one attribute Content and URI is defined as IdentifierBase instead of Identifier. The derived class Identifier extends IdentifierBase with the other attributes IdentificationScheme, IdentificationSchemeAgency, IdentificationSchemeVersion and may then be used in situations where all attributes of Identifier are used, e. g. for attribute CountryIdentifier in class Location.

### 5.3 OpenAPI document in YAML format

```

openapi: 3.0.3
info:
  description: |
    This specification describes a sample REST interface of the processes specified in the European standard EN 17419-1:2020
    for Transfer Of Electronic Documents.

    The European standard (EN 17419-1:2020) itself defines the processes and the structure (data model) of the transfer of
    electronic documents, and facilitates the transfer of electronic documents between stakeholders in the insurance industry.

    This API description implements the EN17419-1 as a synchronous transmission process (post).
    The technical acknowledgement therefore is provided in the transmitInsuranceTransaction response.
