

Designation: ~~C1313-05~~ Designation: C1313/C1313M - 10

Standard Specification for Sheet Radiant Barriers for Building Construction Applications¹

This standard is issued under the fixed designation C1313/C1313M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the general physical property requirements of radiant barrier materials for use in building construction. The scope is specifically limited to requirements for radiant barrier sheet materials that consist of at least one surface having a far-infrared emittance of 0.1 or less, such as metallic foils or metallic deposits mounted or unmounted on substrates.

~~1.2 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information only.~~

1.2 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.3 The following safety hazards caveat pertains only to the test methods (Section 10) described in this specification. *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

TAPPI Test Method T 512 sp-02: Creasing of Flexible Packaging Material Paper Specimens for Testing³

3. Terminology

3.1 *Definitions*—For definitions of terms used in this specification, refer to Terminology C168.

3.2 *Definitions of Terms Specific to This Standard:*

3.2.1 *radiant barrier*—a low emittance (0.1 or less) surface used in the construction of a radiant barrier system.

3.2.2 *radiant barrier system (RBS)*—a building construction consisting of a radiant barrier bounded by an open air space.

¹ This specification is under the jurisdiction of ASTM Committee C16 on Thermal Insulation and is under the direct responsibility of Subcommittee C16.21 on Reflective Insulation.

4. Ordering Information

- 4.1 Prior to purchase, for sampling and acceptance procedures, Practice C390 may be agreed to by purchaser and manufacturer.
- 4.2 Specify the width and total area to be installed.
- 4.3 Specify any special markings.

5. Materials and Manufacture

5.1 Sheet radiant barrier materials shall consist of low emittance surface(s) that ~~may be~~ are in combination with any substrates and adhesives required to meet the specified physical material properties.

6. Workmanship, Finish, and Appearance

6.1 Sheet radiant barriers shall be manufactured, packaged and shipped in such a manner that, when received by the customer, they are suitable for installation in accordance with Practice C1158.

7. Physical Requirements

7.1 The low-emittance materials shall conform to the physical properties as specified in Table 1 and local building codes.

7.2 The following physical characteristics of sheet radiant barriers are important:

7.2.1 *Surface Emittance*—Radiant barriers derive their effectiveness from their low-emittance surface. The surface emittance of sheet radiant barriers shall be determined in accordance with Test Method C1371.

7.2.2 *Water Vapor Transmission*—Sheet radiant barriers may or may not be vapor retarders. If the radiant barrier is to serve as a vapor retarder, the permeance of the material shall not exceed one perm, as determined in accordance with Test Methods E96/E96M (Procedure A—Desiccant Method).

7.2.2.1 If the radiant barrier is to be vapor transmitting then the permeance of the material shall exceed five perms as determined with Test Methods E96/E96M (Procedure A—Desiccant Method).

7.2.3 *Surface Burning Characteristics* —The flame spread potential of a sheet radiant barrier product shall be determined for a single test specimen in accordance with Test Method E84.

7.2.4 *Corrosivity*— Sheet radiant barriers shall be tested for corrosion resistance in accordance with Test Method D3310. Evidence of significant corrosion shall be cause for rejection. A corrosion test that results in less than 2 % affected surface is satisfactory.

7.2.5 *Tear Resistance*— Sheet radiant barriers shall be tested for tear resistance using Test Method D2261. The tear resistance shall be included in the manufacturer’s technical data.

7.2.6 *Adhesive Performance:*

7.2.6.1 *Bleeding*—Adhesives, when used in bonding, shall show no sign of bleeding when tested in accordance with the test procedure in 10.1. Bleeding at cut edges may be disregarded. The total of bleeding or delamination, covering more than 2 % of the sample area, shall be cause for rejection.

7.2.6.2 *Pliability*—Specimens tested in accordance with the test procedure in 10.2 shall not show cracking or delamination. This test does not apply to materials that are not flexible and not intended to be bent or flexed.

7.2.7 *Mold and Mildew*— Fungal resistance of sheet radiant barriers shall be tested in accordance with Test Method C1338. The samples are then examined visually under 5× magnification for the extent of mold growth and for indications of deterioration. Evidence of mold growth beyond the inoculation area shall be cause for rejection.

8. Significance and Use

8.1 This specification recognizes that the effectiveness of a sheet radiant barrier is dependent on proper installation. Practice C1158 addresses use and installation of radiant barriers.

8.2 This specification identifies the material properties that are important for sheet radiant barrier products. When appropriate, values for the properties have been stated.

8.3 The user should consult the manufacturer about specific material properties needed for a particular application.

8.4 Radiant barriers shall be free of dust or other contaminants to remain effective.

9. Sampling

9.1 Sampling shall be performed in accordance with Practice C390.

TABLE 1 Physical Properties of Low Emittance Materials

Foils or Deposits
Purity—at least 99 % aluminum (where applicable)
Emittance—0.1 or less
Corrosivity—Test Method D3310 result <2.0 %
Bleeding or delamination—<2.0 %
Pliability—no cracking or delamination
Mold and mildew—growth or delamination outside inoculation area is cause for rejection
