

Designation: E 527 – 83 (Reapproved 1997)<sup>€1</sup>

### Standard Practice for Numbering Metals and Alloys (UNS)<sup>1</sup>

This standard is issued under the fixed designation E 527; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

 $\epsilon^1$  Note—Keywords were added editorially in October 1997.

#### 1. Scope

1.1 This practice (Note 1) covers a unified numbering system (UNS) for metals and alloys that have a "commercial standing" (see Note 2), and covers the procedure by which such numbers are assigned. Section 2 describes the system of alphanumeric designations or "numbers" established for each family of metals and alloys. Section 3 outlines the organization established for administering the system. Section 4 describes the procedure for requesting number assignment to metals and alloys for which UNS numbers have not previously been assigned.

NOTE 1—UNS designations shall not be used for metals and alloys that are not registered under the system described herein, or for any metal or alloy whose composition differs from those registered.

NOTE 2—The terms "commercial standing," "production usage," and others are intended to portray a material in active industrial use, although the actual amount of such use will depend, among other things, upon the type of materials. (Obviously gold will not be used in the same "tonnages" as hot-rolled steel.)

Different standardizing groups use different criteria to define the status that a material has to attain before a standard number will be assigned to it. For instance, the American Iron and Steel Institute requires for stainless steels "two or more producers with combined production of 200 tons per year for at least two years"; the Copper Development Association requires that the material be "in commercial use (without tonnage limits)"; the Aluminum Association requires that the alloy be "offered for sale (not necessarily in commercial use)"; the SAE Aerospace Materials Division calls for "repetitive procurement by at least two users."

While it is apparent that no hard and fast usage definition can be set up for an all-encompassing system, the UNS numbers are intended to identify metals and alloys that are in more or less regular production and use. A UNS number will not ordinarily be issued for a material that has just been conceived or that is still in only experimental trial.

1.2 The UNS provides a means of correlating many nationally used numbering systems currently administered by societies, trade associations, and individual users and producers of metals and alloys, thereby avoiding confusion caused by use of more than one identification number for the same material; and by the opposite situation of having the same number assigned to two or more entirely different materials. It also provides the uniformity necessary for efficient indexing, record keeping, data storage and retrieval, and cross referencing.

1.3 A UNS number is not in itself a specification, since it establishes no requirements for form, condition, quality, etc. It is a unified identification of metals and alloys for which controlling limits have been established in specifications published elsewhere.

NOTE 3—Organizations that issue specifications should report to appropriate UNS number-assigning offices (3.1.2) any specification changes that affect descriptions shown in published UNS listings.

#### 2. Description of Numbers (or Codes) Established for Metals and Alloys

2.1 The unified numbering system (UNS) establishes 18 series of numbers for metals and alloys, as shown in Table 1. Each UNS number consists of a single letter-prefix followed by five digits. In most cases the letter is suggestive of the family of metals identified; for example, A for aluminum, P for precious metals, and S for stainless steels.

2.2 Whereas some of the digits in certain UNS number groups have special assigned meaning, each series is independent of the others in such significance; this practice permits greater flexibility and avoids complicated and lengthy UNS numbers.

NOTE 4—This arrangement of alphanumeric six-character numbers is a compromise between the thinking that identification numbers should indicate many characteristics of the material, and the belief that numbers should be short and uncomplicated to be widely accepted and used.

2.3 Wherever feasible, identification "numbers" from existing systems are incorporated into the UNS numbers. For example: carbon steel, presently identified by AISI 1020 (American Iron and Steel Institute), is covered by "UNS G 10200"; and free cutting brass, presently identified by CDA (Copper Development Association C 36000), is covered by "UNS C 36000." Table 2 shows the secondary division of some primary series of numbers.

<sup>&</sup>lt;sup>1</sup> This practice is under the jurisdiction of ASTM Committee A-1 on Steel, Stainless Steel, and Related Alloys and is the direct responsibility of Subcommittee A01.91 on Editorial.

TABLE 1 Primary Series of Numbers

Nonferrous Metals and Alloys		
A00001–A99999	aluminum and aluminum alloys	
C00001–C99999	copper and copper alloys	
E00001-E99999	rare earth and rare earth-like metals and alloys (18 items; see Table 2)	
L00001–L99999	low melting metals and alloys (15 items; see Table 2)	
M00001–M99999	miscellaneous nonferrous metals and alloys (12 items; see Table 2)	
N00001–N99999	nickel and nickel alloys	
P00001-P99999	precious metals and alloys (8 items; see Table 2)	
R00001–R99999	reactive and refractory metals and alloys (14 items; see Table 2)	
Z00001–Z99999	zinc and zinc alloys	
Ferrous Metals and Alloys		
D00001–D99999	specified mechanical properties steels	
F00001–F99999	cast irons and cast steels	
G00001–G99999	AISI and SAE carbon and alloy steels	
H00001–H99999	AISI H-steels	
J00001–J99999	cast steels (except tool steels)	
K00001–K99999	miscellaneous steels and ferrous alloys	
S00001-S99999	heat and corrosion resistant (stainless) steels	
T00001–T99999	tool steels	
Specialized Metals and Alloys		
W00001-W99999	welding filler metals, covered and tubular electrodes,	
	classified by weld deposit composition (see Table 2)

 TABLE 2
 Continued

M04001–M04999	germanium
M05001–M05999	plutonium
M06001–M06999	strontium
M07001–M07999	tellurium
M08001–M08999	uranium
M10001–M19999	magnesium
M20001–M29999	manganese
M30001–M39999	silicon
P00001–P99999 Precious Metals and Alloys	
P00001-P00999	gold
P01001–P01999	iridium
P02001–P02999	osmium
P03001–P03999	palladium
P04001-P04999	platinum
P05001–P05999	rhodium
P06001–P06999	ruthenium
P07001–P07999	silver
R00001–R99999 Reactive and Refractory Metals and Alloys	
R01001–R01999	boron
R02001–R02999	hafnium
R03001–R03999	molybdenum
R04001–R04999	niubium (columbium)
R05001–R05999	tantalum
R06001-R06999	thorium
R07001–R07999	tungsten
R08001–R08999	vanadium
R10001–R19999	beryllium
R20001–R29999	chromium
R30001_R30000	cobalt
R40001–R49999	rhenium
R50001-R59999	titanium
R60001–R69999	zirconium
W00001–W99999 Welding Filler Metals Classified by Weld Deposit	
Composition	
W00001–W09999	carbon steel with no significant alloying elements
W1000-W19999 W2000-W29999	manganese-molybdenum low alloy steels
	nickel low alloy steels
W30000–W39999	austenitic stainless steels
W40000–W49999	ferritic stainless steels
W50000-W59999	chromiun low alloy steels
W60000–W69999 ASTM E527-83(1997	copper base alloys
W70000–W79999 ps//w80000–w89999 w80000–w89999	surfacing alloys
	nickel base alloys
Z00001–Z999999 Zinc and Zinc Alloys	

<sup>A</sup> Alloys in which the rare earths are used in the ratio of their natural occurrence (that is, unseparated rare earths). In this mixture, cerium is the most abundant of the rare earth elements.

2.4 Welding filler metals fall into two general categories: those whose compositions are determined by the filler metal analysis (e.g. solid bare wire or rods and cast rods) and those whose composition is determined by the weld deposit analysis (e.g. covered electrodes, flux-cored and other composite wire electrodes). The latter are assigned to a new primary series with the letter W as shown in Table 1. The solid bare wire and rods continue to be assigned in the established number series according to their composition.

NOTE 5—Readers are cautioned *not* to make their own assignments of numbers from such listings, as this can result in unintended and unexpected duplication and conflict.

2.5 ASTM and SAE periodically publish up-to-date listings of all UNS numbers assigned to specific metals and alloys, with appropriate reference information on each.<sup>2</sup> Many trade

associations also publish similar listings related to materials of primary interest to their organizations.

# **3.** Organization for Administering the UNS for Metals and Alloys

3.1 The organization for administering the UNS consists of the following:

3.1.1 Advisory Board—The Advisory Board has approximately 20 volunteer members who are affiliated with major producing and using industries, trade associations, government agencies, and standards societies, and who have extensive experience with identification, classification, and specification of materials. The Board is the administrative arm of SAE and ASTM on all matters pertaining to the UNS. It coordinates thinking on the format of each series of numbers and the administration of each by selected experts. It sets up ground rules for determining eligibility of any material for a UNS number, for requesting such numbers, and for appealing unfavorable rulings. It is the final referee on matters of disagreement between requesters and assigners.
